THE COLMORE CUP

Percy Newman - 1st class certificate
G. Dallison - - 2nd class certificate H. U. Smytheman - 3rd class certificate

The above machines ran consistently throughout and all finished dead to time. Comments of "The Motor Cycle" on their

bertormance-

On Saintsbury Hist.—" Quite a number selected to play safety by making a steady start and sure climb. Among these may be mentioned P. Newman (Ivy)."

On Rising Sun Hill.—" (——) made a good performance on the lower slopes as did H.

Smytheman (Ivy).

At Wille sley .- "The best climbs which we noted were made by P. Newman (lvy), etc.

Re Comments on the Trial—

"The modern two-stroke is no longer a toy.
Some of the best climbs of the day were accomplished by (----), lvy, and (----), two-strokes.

NOTHING, nothing, and what is the reason why, when one gets to the end of life there's nothing to do but die.

o do but die.

NOTHING. Yes, its a fact; mind you don't die prematurely, that's ull.

NOTHING will help an inadvertent snichle more than a wretchedly made sidecar.

NOTHING'S worse than the feeling caused hy traction engines passing over one's dining room, whether tight laced or not. In fact, 'tis sometimes fast.

NOTHING is spared in expense or trouble to pro-duce the best chassis possible at Middleton's, NOTHING we require in exchange for the finest sideear made except the dough, the old dough, and nothing but the dough,

and nothing but the dough.

MOTHING too troublesome Special department for linsy individuals. Gent walks in, wants sidecar, match flance's stockings. Certainly, send lady along, Ab., morning madain, this way for the studio. H'in. Yes, very nice, et—stockings. Shot slik are they? B'in. Want shot puint to match I suppose. Alright, away got agam—yes, a grease gun. Nothing too much totable at our stores, our sincteenth century stores. What the dickens are we singing about? NOTHING worse than amatents attempting adver-tisement writing. It's not in my line, I'm the olumber. Shakespeare excuse us quoting the barred, he fact is we are Middleton's

Competitions.

A FLOOD of competitions such as occurred at Easter cannot fail to demonstrate the extraordinary amount of public interest which centres round the motor cycle movement. Crowds gathered at all points of interest to watch the events, and big entries were the rule.

In another part of this issue we analyse the results of a trial in which there were nearly two hundred entrants, and we consider that such an analysis is of considerable public interest. It must be remembered, however, that such has been the influx to the ranks of motor cyclists that many unskilled riders are taking part in competitions which require at least some knowledge of riding if success is to be attained. It is not the easiest thing in the world for a novice to make a clean ascent of a really severe hill, even if his machine has ample power for the climb. Severe gradients have more often than not bad surfaces, owing to road-making difficulties, and the negotiation of rough and treacherous hills is an art requiring long practice. It is surprising also how hard it is to maintain a steady 20 m.p.h. average.

It may be argued that strict timekeeping should not be necessary in long distance trials, and with this, to a certain extent, we agree; but it is an undoubted fact that a schedule speed adds considerably to the difficulties of a trial, and forms a convenient method of eliminating doubtful machines and poor drivers. Hill-climbs still form an attractive feature on club programmes, and in all probability will continue to do so as long as motor cycles exist. They provide an element of sport which is not obtainable to the same degree in other road events. Their utility is perhaps questionable, since the winning machine in a hill-climb is seldom such as one would choose for long distance touring.

Brooklands is perhaps the best testing ground for motor cycles, since it is possible to work an engine much harder on the track than road conditions ever permit; and, if only a few of our younger enthusiasts were timed over three laps of the famous racing track, we should hear less of the wonderful speeds which their mounts are reported to achieve.

Club Teams in the Big Trials.

ROM time to time we have heard complaints made by private riders to the effect that against the trade experts there is very little chance of competing successfully in any of the big events, such as the Six Days Trials. This state of affairs should not be, and, in order to disperse such an impression and to give those who ride merely for sport the necessary encouragement, we think that the A.C.U. might well consider the inclusion of a club team prize in the 1920 Six Days event. Such an award could be made under conditions similar to those appertaining in the case of trade team entrants.

Several of the larger clubs could bring forward teams of three riders who would be only too glad to compete in the knowledge that their success would be measured against that of riders whose chances were not more favourable than their own. Under present circumstances, the events in which one club can compete against another, as a club, are decidedly few in number, and a success in no single one of them carries the prestige to be obtained by a team win in the Six Days Trials.

It need not be necessary to insist on any particular constitution of the teams as regards the machines ridden, as the marks could be compared on a percentage basis, but it might be advisable that one sidecar and two solo machines should be entered by each competing club. One rule should be compulsory, however, and that is that no trade entrant should be allowed to ride at the same time as the member of the club team; this proviso would not prevent a well-known trade rider competing for his club, but he would be doing so in his private capacity.

Front Brake Shoe Fitting.

CORRESPONDENT asks me to draw the attention of designers to the mounting of the shoes of front rim brakes. He points out that on certain machines the shoes are clamped to stirrups of circular section, and that if the clamping nut shakes loose the shoe is liable to twist across the line of the spokes and rip them out, with disastrous results to the rider if the speed chances to be high. A most unpleasant subject, gentlemen. On reading this letter I hied me to my garage, and found two machines with brakes of this character. I have not exceeded 60 m.p.h. since.

Wheels and Brakes.

AM just furbishing up a 1919 machine for its new owner. It has covered no great mileage, but, being very fast, has undergone a deal of brake usage. I cannot make two portions of it look presentable without having them done at the factory; and if I restore their pristine neatness, they will be shabby again before the new owner has ridden the machine ten miles. Needless to say, both rusty details are brake paths. One is the inner rim of the front wheel, and the other is the special brake rim fitted to the rear wheel, which is chain-driven. Both brake paths are red with rust, though the rest of the machine shows no perceptible signs of use, except-another silly item-where the handle-bar dented the tank when a friend came a cropper. The obvious remedy for this staring fault is the internal expanding brakes. I have never loved such brakes on cars: they wear more rapidly than a belt rim type of brake, and they are apt to reach their "na poo" point at inconvenient moments without much warning. But they have such clear advantages in other directions that we shall hope for their success on bicycles. After all, a bicycle wheel is very nearly as big as a car wheel, whilst the braking stresses are much lower, so that it should be possible to make the internal brake last well on two-wheelers.

Begin with a Motor Bicycle.

URING the last week or two I have been playing mentor to a neighbour who is making his debut as a motorist with the aid of a four-cylinder car. My pupil was well above the average in education and intelligence, but had never previously tackled any mechanical job more difficult than hanging pictures. During my struggles to make him at home with an engine and gear box, it was borne on me what an immense advantage an apprenticeship on a motor bicycle is to the intending car owner. Up-to-date the tyro has not inflicted any particular damage on his expensive chassis, though it says much for his

gear box that it did not resent reverse gear being engaged by mistake for the second forward speed. But if I had not been at hand, he would have taken the road on one occasion with his radiator half empty, and the oil level in the crank case at the danger mark. Quite apart from the risk of smashing up a costly vehicle during the early period of the novitiate, the car novice is apt to be a public danger. He will usually handle his projectile with extreme caution, but it occupies a big slice of the road, and other traffic is apt to credit him with more skill than he possesses; in fact, the ordinary insurance policy does not cover a learner. Moreover, the task of mastering such a complicated piece of mechanism as a car is very exhausting to a novice, and his first roadside troubles often baffle him altogether. It is pleasanter, cheaper, and safer to begin a motoring career with a motor bicycle.

Nothing Like It.

FTER months of cold and grease a real spring day actually dawned this morning, and I go out on the roads at once. During the assorted samples of weather which have afflicted us since las-October, I have often been tempted to accept proffered seats in cars, and my lower nature has occasionally wondered if a car is not really the goods during : British winter. But on a day like to-day there car be no option. Give me the two-wheeler every time Just a slice of dry road 4ft. wide. One finger on the throttle, and the other hand anywhere you like. No gear change for one hundred miles or so. No slacken ing of speed the livelong day, except where traffic compels: the worst main road hill asks for no more than a twitch of the throttle finger, and the pace remains as high as it was on the level. Half a day costs you no more than a dollar, and you can mor up the procession of profiteers driving American cars Such cars, too. Most of them cost about £1,000 in England, though their American list price may be little over £300, and their quality in some cases is so poo that nobody dared to import them before the ca famine made anything on four wheels worth its weigh in platinum.

Nutlocks.

AM not one of those riders who consider that ever nut on every machine should be spring-washered, o split-pinned, or visloked, or otherwise safeguarded The average motor cycle is destitute of a single nutloc of any sort or kind, and in prolonged ownership c any decent machine, we only lose half a dozen bit per annum. But I do hold that certain vital part require more safeguarding than accurate workmanshi affords. Here is a case in point. The rear brake of my machine developed a scrape in the rim. I sa

Occasional Comments .--

nothing of the trouble I met in trying to centre that errant shoe. My point is that between the boot pedal and the belt rim there were six unsecured screwed connections—four ordinary nuts, and two threaded pins devoid of nuts. This is indeed design with a capital D.

Chain Spares.

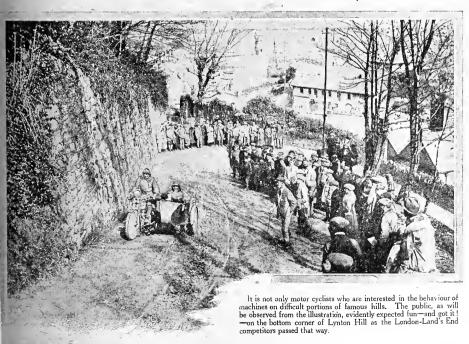

MANY thanks to the kindly correspondents who put me on the track of a few chain spares. I have shown remarkable self restraint, and, in view of the prevailing shortage, have merely bought a few odd links. But my post bag proves that a few provincial dealers can still supply oddments, even though complete spare chains appear to be everywhere unobtainable.

£5 v. £25.

purists will, I hope, excuse my taking round figures to express the comparative cost of full electrical equipment and gaslighting outfits. It is too easily taken for granted that we shall all rely on electric light in the near future. No doubt the competition man and the motor cyclist de luxe will adopt the more convenient system regardless of expense. But the outstanding fact is that an acetylene outfit, whether of the generator or compressed storage type, costs about a fiver, whereas a good electrical outfit tots up to about five times that amount retail. Buyers are already squealing about the cost of motor

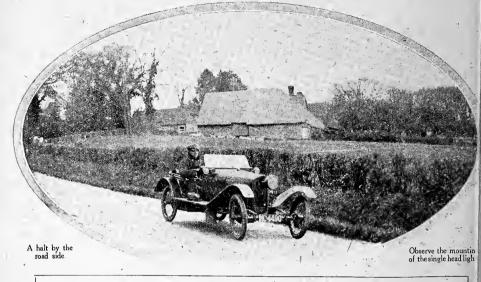

cycling, and there is still far more money about than will be the rule in coming years. Various correspondents have summed up the position of dissolved acetylene with considerable point and accuracy. If this system is efficiently handled by the manufacturers, it is barely inferior to electricity in convenience and reliability, and is unquestionably a great deal cheaper. Between it and the portable generator system there can be no comparison whatever, any more than the latter system can hope to compete with electricity except in price. The firms who have the right to produce dissolved acetylene possess a gold mine if they will only exploit it properly. Two friends of mine have just obtained quotations; in the one case the cost of D.A. was £3 15s. exclusive of lamps; in the other case, £23 78, was quoted for electric lighting, inclusive of lamps, but the motor cycle manufacturer concerned did not recommend this costly outfit, as it had given him quite a bit of trouble in other cases. These figures are significant. If the high prices now obtainable for motor bicycles have led some traders to imagine that a £20 extra for lighting is a mere bagatelle, let them reflect that there are thousands of motor cyclists who cannot and will not pay over £100 for a solo mount; and that sundry firms intend to produce masses of £50 machines within a year or two. A £20 extra on a £140 machine is not frightfully formidable; but a £20 extra on a £50 jigger is quite another pair of shoes. Acetylene lighting is not dead yet.

AN AWKWARD BEND ON A FAMOUS HILL.

ROAD TESTS OF NEW MODELS.

Impressions of Two Hundred Miles Running on the G.N. Four-wheeler.

THE G.N.'s SALIENT FEATURES.

Engine: 90° twin, air-cooled, 84 mm. bore, 98 mm. stroke, 1,098 c.c. capacity.

Transmission: Shaft to countershaft, thence by chains to rear axle. Three speeds and reverse.

Dimensions: Length, 10ft. 6in.; width, 4ft. 4in.; wheelbase, 8ft.; track, 3ft. 6in.; ground clearance, 9in. Weight: 61 cwt.

Wheels: Wire type, 650 × 65 mm.

Steering: Bevel geared.

Price: £215 Tourist Model complete, hood, screen, speedo-

meler, etc. Vitesse Model; £250.

A LTHOUGH the G.N. is a small car, it appeals particularly to motor cyclists because all the components of the chassis have been developed along motor cycle lines until no part from front axle to tail light is either unfamiliar or temporarily incomprehensible. All motor cyclists will recognise in the side starting-handle a substitute for the kick-starter, as which, incidentally, it is sometimes used. As to dog clutches and chains, disc clutches, and expanding brakes, all these can now be found in various forms on the modern two-wheeled machines.

On the road the G.N. handles well; its gear change is easy, so easy, in fact, that the sorriest novice could make neither mistake nor noise once he had become accustomed to the peculiar movement in changing from first to second. Both foot and hand throttles are provided, and each can be used with equal facility. On a really bad road we found the car inclined to wander under the succession of violent road shocks, but this is almost generally the case when a motor cyclist first takes the wheel, or having been used to lorries in the M.T., gets on a very much lighter machine. No machine as light as the G.N. is easy to spring so that all conditions may be suited, while the proportion of passenger weight to chassis

weight makes the presence or absence of the second passenger very noticeable on bad surfaces. Give a good, or even an average, road surface you is spin along merrily for mile after mile, be the reexceptionally hilly or just flat, while on severe gradies the lowest gear ratio is a boon and a blessing. The congine is naturally not so quiet as a water-cood "four," and withal has an extremely peppery exhaus the there is no doubt about the liveliness of machine nor concerning its speed.

Satisfactory Air Cooling.

Since the G.N. has been for some years an accompetitor in most long-distance trials, its air-coop system may be said to have proved itself, and may add that during some 200 miles of testing at mandas, the cooling was the last thing to think above either, in traffic, on hills, or during a fast streed in, the application of either briake yet had bedden, the application of either being rather harsh, may particularly in the case of the foot brake, but again there is no doubt as to the power of either pairs shoes.

During the time that we had the runabout, circustances caused it to be left standing in the rain or

Road Tests of New Models -

over an hour, yet the exposed plugs took no harm and restarting was not difficult. In traffic you could scarcely have a more manageable machine, and the slow running of the engine is beyond reproach. With hood, screen and lighting set, spare wheel, and a comfortable seat, there is little cause to envy even the long super-cars which cost four times the money, for

it all comes down to one thing—the G.N. is value for money. The fact that its price is approximately the same as a sidecar machine of similar power shows that Messrs. G.N., Ltd., have seriously tackled the production problem, and have achieved what many have thought impossible. Moreover, the prices are not provisional, and for twelve months a consistent output has been kept up. It was one of the original British cycle cars, and to-day holds its place in the front ranks of light four-wheelers.

(Left) The G.N. on one of the dangerous corners on the Brighton Road. Note that the ordinary fences have been replaced by wire ones.

(Right) A rear view of the G.N., taken within a few miles of Brighton.

A REAR SPRINGING PROBLEM.

The Necessity for having the Carrier on the Spring Portion of the Machine.

N the case of rear-sprung machines, the problem of springing the carrier in unison with the frame is one which adds yet another knot to this already notty proposition. The object to aim at is, of ourse, an absolute minimum of unsprung weight, ut, if the carrier and rear mudguard be sprung, a ery considerable clearance must be left between the heel and the guard. This is undesirable, not only tom the point of view of appearance, but because ut, accumulated on the inside of the guard, is apt come in contact—with the wheel when the springing aches its extreme limit. The binding, which would ten momentarily occur, would very soon demolish the ead of the tyre, and might cause serious sideslips at seed on a greasy road.

But, though there are difficulties in the way of bringing the rear mudguard, there is no great diffiilty in springing the rear carrier.

We can take it that, given any choice in the matter, e average rider would prefer the system of rear ringing which gives him a sprung position for his t, etc., to one which forced him to accept the long-lt inconvenience of worn-out tool rolls, and of having sling the delicate articles of his personal gear und his neck to save them from destruction. We us arrive at the conclusion that the system giving the

"absolute minimum" of unsprung weight will be most sought after, and that other systems, though they may present a neater appearance, cannot be regarded as permanent, because the advantages offered by the spring carrier are only second to those of a spring position for the rider.

Is a Wide Range Desirable?

In the old days of pleasure touring, I often sighed for a machine which would enable me to carry my goods and chattels so that they would not be jolted to pieces.

Provided that the action and reaction of the springs be sufficiently deadened by friction, very slight motion of the frame would ensure the comfort of the rider, and it would seem that many manufacturers are overambitious as regards the range of springing, thereby adding many difficulties to the problems of design. The greater the range of springing the greater the difficulty of retaining wheel alignment, the greater the difficulty of retaining wheel alignment, the greater the wear on working parts, and the greater the clearances that must be allowed; while that "luxurious floating motion" is difficult to obtain without some sacrifice in the nicety of the steering at high speeds. Personally, I would vote for the system giving a limited range and the aforesaid "absolute minimum," in preference to one which compelled me to carry my gear as unsprung weight.

London-Land's End: The Results Analysed.

Why such a Comparatively Big Percentage of Failures in Reliability Trials?

Γ cannot be questioned that any owner

A of a modern machine would undertake a journey of 314 miles without fear of failing to accomplish the journey to a set schedule of 20 m.p.h., and in ninetynine cases out of a hundred he would reach his destination to time. In the course of a year a large number of motor cyclists make similar journeys, and the sum total of their stoppages may amount to a change of plug, a broken belt, or a punctured tyre: Yct, put these same men in a competition-like the recent London-Land's End event, and the percentage immediately falls

Why is this?
For the monotoring public to learn that of the seventy solo machines which started in this competition only 80% finished conveys an impression that motor cycles are not so reliable as they have been led to believe. The percentage of finishers in the sidecar class was only

66% of the starters, and in the light car class, 69%.

From the viewpoint of sport, all interest would cease if the awards were much more numerous, but the figures given above relate to finishers only.

That 80% of the solo riders finished may be taken as a good figure. But is it? In analysing the awards, we find that only 60% secured gold medals, that is, accomplished the journey without loss of marks; this figure represents 75% of solo riders who finished. Not quite 20% of the solo finishers secured silver medals for accomplishing the distance without heing more than fifteen minutes early or thirty minutes late at any of the controls. Gold and silver medals together make 72% of the competitors who started on the trial.

The Siderars and Runabouts.

The sidecars were less fortunate; in fact, only 66% of the starters finished. Such a percentage in a strenuous trial, over a series of the worst hills in this country, would be good. Of course, such hills as Porlock and Lynton places this year's Jarrott Cup Competition almost in the same category, especially since the surface of Lynton was bad. Neverthe-

less, intending purchasers of sidecars take the results too seriously hesitate before investing in a machine the second type a parallel to the second type as the second type

apparently so unreliable.

That only 69% of the light finished reveals that the average six is very little less reliable than the average light car, and few buyers hesitat buy a light car because of any car on this point. Therefore, trials retained and anyone viewing them should ren ber that there are many things trial which are not encountered by motor cyclist who uses his machine touring, and that the average of could cover the route of almost any in organised without trouble. For a pleasure, perhaps, he would not atture average 20 m.p.h. over bad roads a make non-stop climbs of, the see hills. In the meantime, these riders in compete in the trials are doing good in assisting to improve the breed of 1 acycles

Reminiscences of the Trial.

Incidents Observed by "The Motor Cycle" Representative on the Route.

THE 4 h.p. Coulson, ridden by R. B. Clark, appeared to be running very smoothly at such times as we met it. The machine was fitted with a novel spring fork combining leaf and coil springs.

Watson Bourne had a 24 Blackburne engine fitted in the frame of his 4 h.p. machine. Unfortunately, the plunger of his gear striking lever fell out, and, in consequence, he had trouble on hils through the low gear jumping out.

W. E. Brough is an old stager who is not often seen in competitions nowadays. All the more credit to him that he succeeded in taking his 5 h.p. Brough and sidecar through to Land's End. He was unlucky enough to lose his way, and was, consequently, late at Launceston. His number was 13!

Those who like to see a big twin which will just tick over when running light and develop plenty of power at low speeds should watch Holroyd's twin Blackburne, which is marvellous in this respect.

Another old hand, V. Olssen, rode an 8 New Imperial solo. High-powered machines seemed to be popular, though Hugh Gibson piloted a 2½ Clyno two-stroke and finished with a clean sheet.

C. W. W. Cooper (23 Douglas), the youngest competitor in the trial, arrived safely at "the End," but his father was less successful. We noticed his 3 Lea-Francis being wheeled out of the line at Launceston.

C. W. Bairstow had a nasty accident during the descent of Countisbury. His Indian and sidecar overturned, and he and his passenger were pinned underneath.

The 8 Zenith and sidecar driven by R. Charlesworth finished with a curious fracture in the front sidecar connection, but was still going strong.

The roads between Bideford and Holsworthy and just outside Launceston were particularly wicked, but Bodmin Moor provided the finest stretch we have seen for many a long day.

McKeand's flat twin Harley purred along beautifully, and the rider had bad luck in suffering a sooted plug on Lynton after the descent of Countisbury.

Narrow roads after the top of Porlock were responsible for at least one amusing incident, for two rival pressmen met and had great difficulty in passing.

H. Karslake made his first appearance in competition work since demobilisation. He rode a 7 Ariel solo, and was, naturally, not worried by hills.

Considering the weather conditions, the surface of Porlock was in a wonderfully satisfactory state. The same cannot be said of Lynton, though a fairly dry but narrow path under the rocks provided a passable surface for solo and sidecar machines.

The Tamplin four-wheeler duly arrived at Land's End, and spectators evinced considerable interest in the Rover and A.B.C. air-cooled light cars, both no competition work.

What a trial for bringing out he old-time competitors! Early in the or towards the tail, familiar faces at the second of the trial of the second of the procession, while W. B. he and C. T. Newsome, two woll-kinds motor cyclists, were at the tail in the cars. Gibb, by the bye, lifted the up in this class.

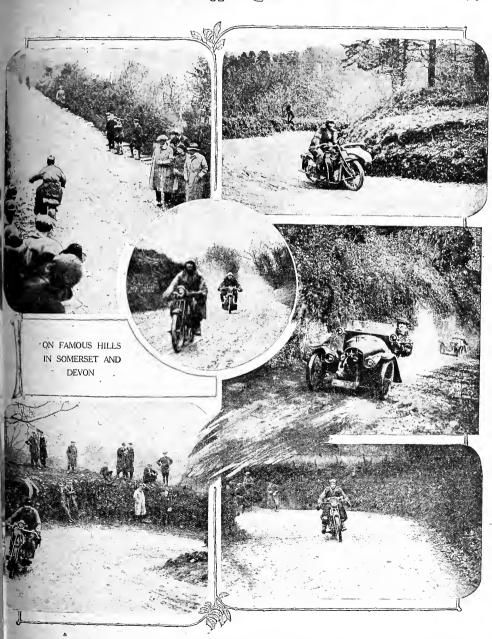

The two 8 Royal Rubys_kept together, and made fine ascents of Ly Hill. The Matchlesses also were ticularly noticeable as a group.

P. Pike's O.K. Union was fitted a three-speed Albion countershaft. The engine he used was that employed the Inverness-Land's End run, and rider swears by the new Progress pl

J. A. Newman had a coach-built at attached to his 3½ Sunbeam, but we clean ascents of both Porlock and Ly P. W. White, on a similar outfit, puless fortunate.

Many a competitor who had not reviously encountered North Devon sorty would have been glad of more tin admire the views.

The name of Parracombe appearing the route does not imply an ascent obsidered "Beggar's Roost." The hibst of Parracombe village which competes had to tackle is nothing out of the ordinary for that part of the world

Competitors in the recent London-Land's End Trial are shown negotiating different parts of Porlock, Lynton, and Artington Hills.

LONDON-LAND'S END RESULTS.

^{*} In the case of one light ear, additional award under consideration.

IN THE DEVASTATED AREAS. (Top) Many visit the battlefields on a sorrowful errand, to see the graves of those who have passed over; the graves registration surveyors who assist them use motor cycles in their work. (Centre) The motor cycle and sidecar is useful in carrying both people and goods in the ruined towns. (Bottom) Halt at a wayside estaminet on one of the old battlefields, near Chateau Thierry.

Some Calculations showing how the Cost per Mile Decreases as the Mileage Increases.

NE is often asked how much it costs to run a motor cycle, and the answer to the question is one which must always be of considerable importance to the ordinary purchaser, who is usually a man of distinctly limited means.

Unfortunately, it is never possible to give an exact answer, and it is possible that this uncertainty about what expenses may be involved deters many potential

enthusiasts from taking up the pastime.

The truth is that expense is greatly affected by a large number of factors which are mostly unknown in any particular case. Quite apart from the obvious fact that a big twin and sidecar will cost much more to run than a baby two-stroke, there is a very big personal element.

I do not think it would be any exaggeration to say that the expenses of two riders of different temperament—quite apart from questions of skill—riding

identical machines might differ by as much as 30% or more, if taken over long periods. Indeed, I believe that one might spend twice as much as the other. If you must always have the very last word in machines, if you are too lazy or too busy to do all cleaning and repairs yourself, if you want the very latest and best accessories, and if you always drive your machine to the limit of its capacity, you will find that you can get through a surprsing amount of money in the course of a few seasons. If, on the other hand, you take a pleasure in doing everything yourself, if you study economy, and enjoy the process of "making things and if you drive steadily and carefully, you will find that motor cycling is one of the cheapest amusements going for the amount of fun you get out of it.

How Costs are Increased,

from London after a dance. a vile night of wind, rain, and sleet, and

about three miles from home my back tyre, which had been giving trouble all day, finally went flat for good and all. Back tyre repairs on this machine are never pleasant, and it was clearly a case for deciding whether . to spend the greater part of some time labouring dolorously in the mud, and dark, and wet, probably ruining my dress clothes the while, or whether to

abandon the 'bus, walk home, and send out a break down gang the next morning. Problems of this kin are, fortunately, fairly rare, but their solution depend largely on temperament and are likely to make a bi difference to running costs. The temptation to slin the machine into the local garage and leave the worl men-to do some minor repair what time you g and get lunch is often strong, but it must be stern repressed if you are really out for economy.

Then again there are all sorts of incidental expense which may be indirectly incurred-such as meals : hotels instead of at home—but there are also incident. savings of train fares and taxis and sometimes I myself, for instance, living within twen miles of London, find it cheaper to go up-e.g., for a dance-by road and to come home again afterware than to travel by train and to put up at an hotel.

If the machine is used regularly for business pu

poses or for any journeys which wou otherwise be done by train, this savin may be very important, and the net co of keeping a machine would be muc lower than if it were used solely for joy-rides." Even here the person factor is important, for much wi depend on whether you normally trav first-class and by taxi or third and I tube or 'bus.

It is a common practice to sta running costs in terms of cost per mi run. This is sensible enough, but should be remembered that, quite apa from the personal factors which I have just mentioned, the cost per mile wil vary greatly with the total mileage run This is of great importance to the ma who is trying to estimate how muc if at all, he will save by doing journeys by road rather than by rai I have, therefore, worked out table and curves of running costs for differe types of machines running over differe distances. I have taken three type as representative, the solo lightweigl supposed to be about 21/2 h.p. two

four-stroke; the standard type of 31/2 h.p., and the biggish twin with sidecar. These, I think, are a that need be considered for purposes of illustration Anyone interested in other types of solo or sidec machine can interpolate.

The most difficult item to assess is depreciation which depends so largely on the care with which

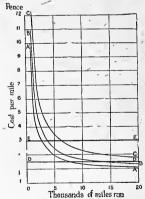

Fig. 1.—The curves show at what mileage it becomes cheaper to travel by train than The other night I was driving a well-known make of three-wheeler down from Lordon of three-wheeler down heavyweight. BB, solo mediumweight. CC, heavyweight. DD, train, third class. EE, It was train, first class.

Running Costs .-

the machine is treated and the buying and selling skill and luck of the owner. Some people have a genius for this sort of thing, while others seem fated always to buy dear and sell cheap.

I have been obliged, of course, to make certain assumptions and guesses, and, therefore, the curves must not be taken as being really accurate. They serve, however, to show how the cost per mile decreases inversely as the distance run, and how each type of machine compares with railway travelling in the matter of expense.

I have assumed moderate prices for the lightweight, the 31/2 h.p. machine and the sidecar outfit; I have reckoned interest on capital at 5%, and insurance for the three machines at £2 15s., £3, and £5 respectively. Tax, registration, driving licence, and overalls I have put down at £5 in each case.

I have assumed that the machine is bought new and is sold at the end of the year, and have accordingly allowed £15, £20, and £30 for de-

I estimate that petrol will cost

preciation.

about .45d. per mile, at present, for the lightweight, .55d. for the 31/2 h.p., and .75d. for the sidecar train, first class. Oil, .08d., .11d., and machine. .13d.; but this will vary greatly with the make of machine and the speed at which it is driven. The last factor makes it very difficult to allow for wear

and .3od., for the "three cases respectively.

of tyres, but I have reckoned these at .17d., .2od.,

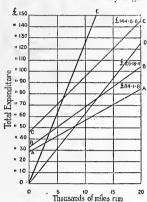

Fig. 2.—Showing the total expenses of the various forms of travelling for distances up to 20,000 miles. AA, solo lightweight. BB, solo mediumweight. CC, heavyweight and sidecar. DD, train, third class EF.,

I have assumed that the owner will be able to do all running repairs, and I have allowed the sum of $\int_{0.5}^{\infty} 2 \cos x$ in each case for the renewal of worn parts after 10,000 miles.

These are only rough approximations and are bound to vary a good deal in individual cases, but I do not

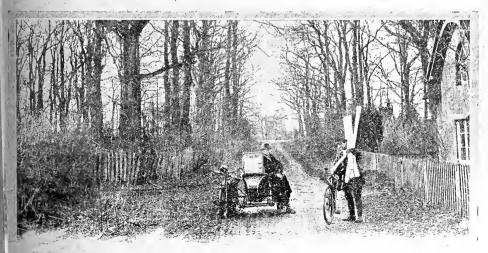

think that the curves are misleading in the main. They show (fig. 1) that the lightweight begins to get on terms with the train at about 2,750 miles for first-class travelling, and about 7,500 for third-class; the corresponding distances for the 31/2 h.p. are about 3,500 and 12,000 respectively.

The sidecar outfit, driven solo, would not have a chance against the third-class train until about 35,000 miles had been covered. But if the fare of the passenger is counted in, it begins to score at the 6,000 mark.

The same thing is shown in a different way in fig. 2. This gives the total expenses of the various forms of travelling for distances up to 20,000 miles.

These calculations are based on the assumption that a new machine is purchased at the beginning of the year. If the owner buys secondhand, the charge for depreciation will be much less, but expenditure on repairs will be higher.

So much depends on the individual driver and special circumstances that the figures given might be greatly modified in any given case. I think, however, that they may show how running expenses are likely to turn

ON ESTATE WORK. Owing to the high price of small cars, the sidecar is now being used more extensively by estate stewards. In the above picture the owner of an Ariel is discussing internal combustion engines with the handy man, who tends the electric light plant in his spare time.

NEW IDEAS IN ACCESSORIES.

Brief Notes on Many Devices Recently Submitted.

An Adjustable Lamp Bracket.

REQUENT annoyance is caused when, after purchasing a lamp bracket for the sidecar, it is found that the position of the tang makes the lamp, when fitted, point

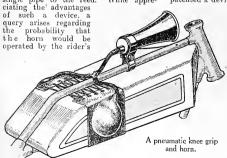

An adjustable lamp bracket.

in an undesired direction. A novel fitting produced to obviate this diffi-culty is shown in the illustration. The tang is held in the end of the bracket by means of a washer and nut, which latter, when slackened,

enables the lamp enables the lamp to be adjusted in the required position, after which the tightening of the nut holds the tang rigidly by the bracket. This accessory may be purchased from Messrs. Dunhills, Ltd., 359-361, Euston Road, London, N.W.1, price 4s. 6d.

Operating the Horn by the Knees.

WITH the idea of operating a horn · without having to hands from the to remove the handle-bar, hands from the handle-bar, Messrs. Alexander and McLay, of 15, Cranbourne Avenue, Park Road, N., Birkenhead, have patented the device illustrated. It will be seen that it is intended to embody two bulbs in kineepads, from which rubber pipes are carried to a Y connection, thence by a single pipe to the reed. While appreciating the advantages of such a device, a query arises regarding the probability that

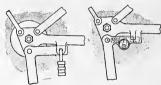

knees at other times than when wanted. Probably it would be possible to have a valve near the reed which could be operated by a small lever on the handlebar by means of a Bowden wire.

The advantages of such a horn, if The advantages of such a horn, it properly controllable, would be approximate to those of an electric horn, and it should meet with a ready demand. We understand that the inventors are open to negotiate with accessory makers

for the manufacturing rights.

A Lock for the Stand.

IT will not be very long before every motor cyclist will either fully insure his machine or have it equipped with an efficient lock to prevent it being stolen. Even when a machine is insured,

Two methods of locking the motor cycle stand in position.

the owner should take every precaution against theft, as, apart from the moral, aspect, there are difficulties attending the purchase of a new machine.

We are glad to see that inventors are We are glad to see that inventors are turning their attention to the scope that exists for locking devices. Personally, we favour fitments which prevent the machine being wheeled altogether; and in this connection Messrs. Merring and Jones, Alderley, Stepps, Glasgow, have patented a device for locking the stand.

In one form, the lock is embodied in the stand arm, the bolt of the lock being inserted in a socket in the frame member. This may be open to criticism on the point that mud would probably fill up the orifice. The other form illustrated uses a padlock, which obviates Apparently part of the lock has to form an integral portion of the stays, in which case it limits the use of the invention to new or reconstructed motor cycles, Another

criticism is that the device would be found of greatest value on solo machines only, as with modern sidecars the weight is usually too much to induce the owner to lift the machine on to the stand.

A Speedometer Drive Protector.

A CORRESPONDENT, Mr. F. I Tippett, 31, Charlton Road, Blacheath, London, S.E., has invented and patented a device for protecting the gear wheels of the speedometer transmi sion. The idea originated in his havin to renew the driving gear wheels of h speedometer so often, owing to grit ge ting in between the cogs and causin wear to the parts.

The device consists of a casing encle ing the two gear wheels, and fitted wi a V shaped grove on the exterior, that any mud dropped from the fro wheel runs clear away.

> V-SHAPED GROVE

A speedometer gear wheel protector.

The section of the edge cover assum the shape of an M, and Mr. Tippe claims that this shape makes the protect suitable not only for speedometer ge wheels, but for other purposes as we such as belts, chains, belt pulleys, h cones, etc., of motor cycles.

A Useful Motor Cycle Cove

THOSE of our readers who have oft to leave their machines exposed all weathers will find the not cycle cover brought out by the Howa Car and Cycle Cover Co., 41, Fetter Lar London, E.C.4, to be an exceeding useful accessory. The cover is made water and rot-proof canvas, shaped fit over a motor cycle or motor cycle a sidecar. Its top is designed to prese a sloping surface to the weather, so the

.n answering this advertisement it is desirable to mention "The Motor Cycle."

"A ROADSIDE ADJUSTMENT."

The A.A. patrol lends a helping hand.

"CARRYING ON."

How new A.A. members will benefit by the example of the "First Hundred Thousand."

THE present season will undoubtedly be a record one for the motoring world; deliveries are being speeded up; the output, in certain works, has been increased by 100 per cent. during the last three months, relations between employers and employees are better—in fact, all branches of the industry are "carrying on" to the best of their ability, and ensuring their share of the increased production, which is vital to the life of the nation.

Already there are more motor cyclists on the road than ever before, consequently, the ubiquitous A.A. Badge is even more in evidence, and, as a result, the Automobile Association's benefits of membership have been further increased.

During the last twelve months the Association has instituted "Mechanical First-Aid" Machines, a Day and Night Roadside Telephone Service, a "No Cash Deposit" scheme for members taking their motor cycles abroad, Roadside Motor Fuel Supply Stations, and it has extended the Free Legal Defence and Advice Scheme to cover civil cases in addition to the defence of members in respect of summonses under the Motor Car Act.

One would naturally conclude that the subscriptions had been raised to cover these extra benefits, but this is not so, and the subscriptions remain the same as in 1905, when the Association had only a few patrols on the roads between London and the South Coast.

This has been made possible by the "mas membership of the Association; new practi benefits being added as the income from member subscriptions increases."

To day the A.A. has more than 110,0 members, the number is growing at the rate of nea 2,000 each week; therefore, the Association is a to provide Road Service which, for completen and efficiency, cannot be approached by any otlemotoring organisation in the World,

This service includes, in addition to the privileges mention above, free assistance by khaki-clad A.A. patrols on all principal main roads of the country, home and foreign tour facilities, engineering assistance, officially appointed hot agents and repairers, special insurance facilities, etc., etc means of this service the member is looked after the whole the he is on the road, and he is prepared for such emergencies breakdowns, delays, bad road conditions, unsatisfactory haccommodation, incompetent repairers and other discomfo

Therefore, if you are not already a member of the Atmobile Association, you should, in your own interest, join no and participate in the advantages which have been built p by the subscriptions of the "first hundred thousand" member

Full particulars of all A.A. benefits are contained in booklet, "The Key to the Open Road," a copy of which a be obtained, post free, from the Secretary. The Automote Association, 21, Fanum House, Whitcomb St., London, W. (2)

Motor Cyclists in London are invited to call at Helquarters, where a staff of experts is always in attendance give information on any question relating to motoring.

If unable to call, send a postcard to-day, and the boost will be despatched by return of post

A useful waterproof "cover all" for a motor cycle.

water-shed is formed, which effectually rotects the machine against the most iolent downpour.

It is also designed so that it may be olled up and strapped on to the carrier. The device should be a great boon to hose who have to leave their motor cycles emporarily out of doors when garage ccommodation is not available, and hould be extremely useful to those happy notorists who possess week-end cottages which have not any motor house accomnodation.

A Useful Accessory.

AN exceedingly useful tool for motor cyclists is the P. and P. combined belt punch and cutter, which not ally cuts the belt to the required length, ime drills a hole, but at the same

exactly the right distance from the end of the belt. The blade is of the best Sheffield steel, and is detachable, so that it can be sharpened if necessary. Many owners of belt - driven

machines will appreciate the value of this tool. It is made by the P. and P. Engineering Co., 135, Richmond The P. and P. combined . Road, Shoebury-ness, Essex.

belt punch and cutter.

MOTOR cyclists who are fond of tinkering, and garage men who do this in the course of business, have ow the choice of several back-ache-iving stands upon which a machine may e placed for repairs or adjustments. The itest to be brought to our notice is nown as the Marnie, sold by Messrs.

factured by Mr. James A. Marnie, of the Cen-tral Cycle Works, High Street, Montrose, N.B.

As will be seen, the stand is collapsible, so that when not required it can be stored con-veniently. It consists of a wooden platform, 7ft. in length and 20in. wide, provided at each end with hinged steel legs. The machine is run on to the platform when the latter is flat on the ground; the rear wheel

is then raised on to its stand, and the front end of the stand lifted up. A long lever at the rear end assists in raising the plat-form to a horizontal position, also bearing upon the cross member of the stand on the machine to prevent movement. Lowering the frame is apparently just as

A simple and efficient design of leg shield.

simple, the inventor claiming that one person can raise or lower the bench without undue exertion. It would appear that for safety's sake a second person should stand by in case the machine overbalanced.

A Combined Mudshield and Footboard.

AN especially efficient pair of mud-shields and footboards is being marketed by Messrs. Henry, Duke and Co., 82-84, Church Road, Hendon, London, N.W.4. The mudshields, which

extend well above the rider's knee, are pro-vided with side valances, which shelter the feet from mud splashed from passing vehicles. Placed sufficiently low to enable the air to pass over the cylinder, a sheet steel guard fills the gap -between the two leg

shields, and extends backwards under the crank case, protecting the latter from mud thrown up by the front wheel. The mudshields are screwed to Footboards, which are held by brackets mounted on either side of the footrest spindle, whilst a corrugated aluminium plate is fixed to the top of the board.

A Waterproof Suit.

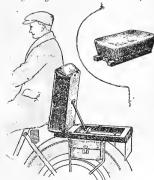

W E have lately been trying a suit made by Weatherproofs, Ltd., 10, Lovell's Court, Paternoster Row, London, E.C.2, and were able to test it to the full on the occasion of a recent trial in heavy rain.

The suit is made of heavy waterproof twill, and the coat is a little longer than the ordinary motor cycle coat, affording some protection to the knees. It is wellmade and perfectly waterproof.

A Combined Pillion Seat and Back-rest.

CRITICISM often urged against back-rests on motor cycles is that they impede the rider when mounting or dismounting. This objection has been overcome, however, as far as it can been overcome, however, as far as it can possibly be overcome, by a device provisionally protected by Mr. C. R. Mills, of Learnington, and which will shortly be marketed by Mesrs. John Denby and Co., Upper Weil Street, Coventry.

Briefly, the accessory consists of a wooden frame with suitable clips for standard motor cycle carriers. Hinged at the front end of this frame is a board on which is mounted a well-upholstered cushion supported on twelve coil springs. cusmon supported on twelve coil springs. In its horizontal position, it forms an excellent pillion—seat, but when not required for this purpose it can be lifted into a vertical position, where it is retained by a spring catch, and so forms a comfortable back-rest. The spring catch consists of a strut secured at right angles to a transverse bar, the

A double purpose pillion seat.

latter being free to slide laterally to a limited extent. A tension spring pulls the strut into the upright position as the seat is raised, and also moves it sideways, so that it catches beneath an abutment at the highest position.

The Editor does not hold himself responsible for the opinions of his correspondents, All letters must be addressed to the Editor "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

CYLINDER CONSTRUCTION.

Sir,-I would like to ask if any reader has experienced aluminium cylinders internally electro-plated with iron or cobalt. Probably the cylinder is to be plated first with copper, then with iron or cobalt, which can be of a great thickness, but I doubt if it will stand against the tempera-

Rasunda, Sweden.

INFLATED PRICES.

Sir,-I have been keenly interested in the correspondence which has recently appeared in *The Motor Cycle* with regard to prices for motor cycles at the present time, and, as a business man, I am keenly interested to know what course the motor cycle trade are taking in the case.

There is a motor cycle agent in my district who has apparently obtained a Triumph, model H, 4 h.p. This he shows in his window to-day. It is listed by the Triumph people at £103, on which, I presume, he gets his usual trade allowances. His price to-day (of which I have two witnesses) is £150. This is not including sidecar, accesssories, or any extras.

I therefore take it that, apart from trade discount (which I happen to know is quite substantial), he is endeavouring to make an extra £27.

Cannot the Triumph Cycle Co. do something to prevent this sort of thing occurring?

I note this agent also has a sign outside which reads "R.A.C. Agent." E.J.L.

seems to be an excellent instrument.

its rather rich mixture until the engine warms up. not out to criticise, and merely wish to learn more of wha JOHN HOLLAND.

PETROL ECONOMY.

Sir,-Being a keen motorist, and anxious to try anythin to reduce the cost of motor spirit, a friend advised me t get fitted a patent combination known as the No. 5 Atomise with angular vanes, and made by the Atomiser Co., of Eas Boldon in Durham.

Accordingly, I had fitted to my new 1920 8 h.p. Sunbear combination these appliances, and decided to give them fairly severe test.

Having recently made a return journey into Scotland of 164 miles on three gallons on the machine as delivered from the makers, i.e., about 54 m.p.g., I thought, being sceptical these figures were too good to be beaten. I therefore set or on March 13th, and in the North met wild weather, snow and half a gale, and on my return on the 15th experience similar conditions.

Now, my friend assured me I should save 25%, so I wen carefully into it, and the mileage worked out at 185 with consumption of two gallons six and a half pints-just abou

65 m.p.g.

In the interest of enthusiastic motorists, like myself, decided that inventions of this description at the presen time should not be missed, hence my writing you.

T. E. SMITH.

CARBURETTER DESIGN.

Sir,—I read with much interest the account of the Eta carburetter in The Motor Cycle recently. It seems to me a most promising design, and I look forward to reading further particulars of its performance later.

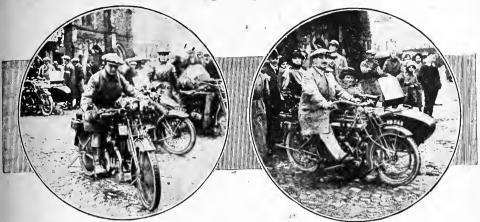

There is, however, one point on which I should be grateful to the inventors for enlightenment. Mr. F. Strickland, writing in The Autocar of March 13th, says: "If reference can be made to Mr. Brewer's book on carburetters, it will be seen that the flow of petrol increases very rapidly with the rise in temperature, owing to the decrease in viscosity. It is, therefore, quite impossible to get the same proportion of petrol to air at different temperatures. and the difference is so great that it is evident that no carburetter, without some adjustment, can be even approximately right through the variations usual in an engine in our climate." I should much like to know how the inventors of the Eta get over this diffiinventors of the Eta get over this alm-culty. It does not seem very desirable that the jet, or valve, as it is more correctly called, should be adjusted from day to day by inexpert riders. Is it possible that the injector device can correct for temperatures?

Presumably, the heating up from the engine can be allowed for by setting the mixture on the weak side (when cold), and relying upon the pilot jet and

PRIZE-WINNING LADIES AT RICHMOND. Miss S. F. Wilson (2½ h.p. Levis), who travelled 59 miles, and Miss E. Dent (2½ h.p. 1915 Douglas), who had the best kept machine, gained the Motor Cycle Manufacturers' Union and The Motor Cycle prizes respectively.

AT THE RECENT MEET AT RICHMOND (YORKS).

W. H. Dodds (3½ h.p. Sunbeam), winner of The Motor Cycle prize for the most ingenious idea (electric lighting conversion).

C. H. Zissler (1917 4\frac{1}{4} h.p. B.S.A. sidecar), who had the best kept machine at the meet.

HOW TO BE POPULAR.

Sir,—May I point out one reason which I think is partly the cause of motor cyclists not meeting with the entusiastic welcome that they might desire at many hotels. I participate regularly in trials, large and small, and I have repeatedly noticed that competitors rise from the table without any thought of tipping the staff. None of us would think of omitting this function if we were hunching alone in similar quarters, and it is hardly sporting to take advantage of being one of a crowd. It may not affect us personally, but it injures the crowd, and adds to the difficulties of trials organisers. A lunch of this kind means much more work for the hotel staff than ordinary routine luncheons, and therefore I would propose that at these sporting events trials secretaries make some provision for the passing of the hat round to the sportsmen concerned. If we are going to ride in trials at all, we may as well conduct ourselves like the rest of civilisation.

B.

FINISH OF NEW MACHINES.

Sir,—Might I take up a little space in your paper with reference to the "finish" of a new machine, of which I have just taken delivery. In view of the great interest which this outfit arouses when drawn up in the City, I think it necessary to point out to potential purchasers of outfits that there are many things which go to make a perfect machine. First, the sidecar. In fitting the press studs to which the cover is attached it would appear that the fitter had put his thimb or hammer on the wet varnish, leaving five blobs which are a constant eyesore. When the screen was fitted, it was necessary to cut away some of the wood work. Instead of touching up the job afterwards, the white wood is visible. Underneath the door is a stain 5in. long, which has been varnished over. These little matters, while trivial, are very annoying, as, unless the machine is perfect when new, the owner feels very little interest in keeping the appearance in order.

Regarding the machine itself, it was found that none of the security bolts had been tightened, the nuts being just started on the threads. This is easily remedied, but it would have annoyed me considerably had I ruined a new tyre through this cause.

The sight feed Inbricator leaked badly, but was, of course,

In conclusion, it would appear that manufacturers do not pay sufficient attention to the little details which mean so much. This is regrettable, as the machine in question runs perfectly, and is one of the most enjoyable mounts I have ever ridden. I am an enthusiast over this particular make, but the one thing which would make me change my allegiance

would be a machine to which real attention had been given to detail and finish.

to detail and huisi.

After all, having paid £210 for an outfit, one expects the "goods"; otherwise I would sooner have the price made £215 if it would save me the annoyance of having those five brown blobs for ever in front of me.

A. BROWN.

ELECTRIC LIGHTING.

Sir,—As a hard rider for some years, I agree with "Ixion" that the electric system with dynamo is the most convenient yet produced. But experience has shown that the dynamo must be gear or chain-driven: leather or spring belts are not reliable enough. Also, can "Ixion" tell me of an accumulator that will stand up for long to high speed touring (unless it is housed in the sidecar, but I often tour solo)? It leaks acid, cracks its case, or else the plates break off the lugs. Why are accumulators placed under the saddle where they get all the bumps? Is not the top of the tank, up in front, the proper place? Why are not all head lamps made with an additional small bulb to light with the big one, so the darkness does not get up and hit you when the

big one burns out?
Electric light is fine when it works, but there is room for a lot of improvement on the usual installations.

Madrid. F. S. ROWE. [We have used a Fuller Block accumulator mounted on the footboard with satisfaction.—Ed.]

Sir,—Having read your article on "Electric Lighting on Motor Cycles" in a recent issue of The Motor Cycle, it has occurred to me that your readers might be interested in the experiences of one who has tried it without success, for I, too, like your contributor, "W.D.S.," have sworn a mighty oath, but have gone back to acetylene again. Some of the points may be a warning of what to look out for. I used a 4 volt accumulator, and ran side and tail lamps, in series, using the ordinary 2 volt pocket pea lamps in these, and an 8 wat 4 volt bulb in the head lamp. For the wiring I tried various kinds of flex, but they all suffered with wet, oil, petrol, and collected dust and dirt, and soon looked shabby. The best I found was Henley's cab tyre sheathed cable, as used for portable lamps in workshops, etc. The only troubles with this were it split (outer covering only) if squeezed at all under the Bowden wire clips—not at first, but after a day or so, according to the amount of distortion caused by the clip; also, the ends at the lamps, terminal board, etc., must be supported, and the weight not taken by the strands of the conductor in the terminals. The C.T.S. wire is oil, petrol and wet, but not benzole, proof. My greatest trouble was inability to keep the acid inside the accumulator, or even to the inside of the accumulator

box. I originally carried this inside the sidecar in much the same manner as "W.D.S." suggests, but what with the acid creeping and splashing about, it got through the box, saturated the woodwork and upholstery of the sidecar, to my great dismay, and might easily have caused damage to the shoes and skirts of my passenger. I then transferred the accumulator to a new box, treated inside and out with acid proof paint, and fixed it to the chassis near the attachment of the head facts the original property of the property of the property of the side of the property of the ment of the back forks, the only place available to gct a safe fixing, and where acid could do the minimum of damage; nxing, and where acid could do the minimum of damage; but the jarring and vibration were too much for the cell, it loosened the plates, opened the seams in the top of the cell, and let the acid out, and eventually jumped a hole through the bottom. Two accumulators have been served in this manner, also flakes loosened by vibration caused shorts between the plates, in spite of the perforated celluloid separation fitted.

I can sympathise with anyone's feelings who experiences being suddenly plunged into darkness on a dark, wet night when travelling along a country road at, say, 30 m.p.h., and when he has got over that, as he hunts for and remakes the broken connection to his accumulator or terminal board. the broken connection to his accumulator or terminal board, and, perhaps, has to find a substitute for the missing screw, or finds that the wire is just too short to reach the terminal. Here I might point out that pretty spiral ends to the wires have a way of catching in the rag or your coat sleeve button when cleaning the machine down, and also they have weight sufficient to cause fracture of the strands of wire under vibration; besides, they collect dust and dirt, unless the whole is encased in a box.

These thirses do haven and from experience I can I

These things do happen, and from experience I say I would rather clean out my generator, blow out tubing, change stopped up burners on the road at night, than have the other thing. When this is done you can get going again, and these troubles with acetylene can be guarded against by proper inspection before starting out, but those of electric lighting I say no most decidedly. With acetylene I always carry a metal polish tin of spare water, carbide, and spare burners.

When I can have a dry battery capable of giving a good steady four to five hours suitable light for a combination, with the battery either rechargeable or capable of 300 hours with the battery either recentrigeable or capable of 300 hours light before renewal, and of a reasonable price and weight, then I will go back to electric lighting again. Dynamo and dry battery is the nearest to perfection so far, but look at the cost and weight of it all.

Ryde, I.W. ONE WHO HAS HAD SOME.

A COMFORT TEST.

Sir,-I was exceedingly interested to read in The Motor Cycle of the suggested machine for measuring vibration. have had such a machine for a long time. It is very simple, and can be fitted to the carrier of a motor cycle which is then driven over a marked course. An exact register is taken of practically every shock received, the whole experiment occupying about thirty seconds.

Comfort, as you very truly state, is most important, and, I think, should be regarded as a part of efficiency.

A. M. LOW, Major. HONOUR TO WHOM HONOUR!

Sir,-I should be obliged if you would insert the following in your valuable journal, of which I have been a reader since 1903.

Having trouble with my magneto, I took it to a .Birmingham firm for an estimate, having to wait several days for this. Finally, I found the charge was £4 12s., which I thought was out of all reason, and, taking the magneto to the Silverdale Manufacturing Co., I was absolutely astonished at the price quoted for repair, viz., 15s., and

the repair would be guaranteed.

I may state that I am not interested or connected in any I may state that I am not interested or connected in any way with the Silverdale Company, my letter being to give the firm a recommendation to "Brum's" motor cyclists.

L. S. DAVIS.

DESIDERATA.

Sir,-Being a motor cyclist of twelve years' standing, may I suggest a few points for the genii in construction to meet with their brainy inventions?

(a) Bad roads may be fashionable for some time to come, therefore the front wheel mud must be dealt with. It never has been even scotched in most machines.

(b) Nor has the problem of a real spring frame. We sit so far back on the machine that the c. of g. is uncomfortably near the resultant road shocks.

(c) Comfort is a great thing—we get it sometimes in the Army. Why not on motor bicycles? Men with short the army. Why not on motor breyeles? Men with short fingers seem to get a lot of cramp from the handles. Personally, I am of that persuasion, although I hold that T.T. bars and pneumatic grips discount the after effects 50%. There is also a sponge rubber grip that does not wear quite-as well, but is good stuff.

(d) About engine construction. Cylinder flanges are too small to get at the holding-down belts and nuts.

(e) Adjustable tappets are a doubtful curse when they get old in the head. "Get a new one," you say, Yes, when it jibs twenty miles from nowhere, and you have to take down the cylinder if you have a spare.

(f) It does not require enormous mileage before induction

valve guides form air leaks.

(a) Why not eccentrics on the half-time shaft, adjustable tappet sleeve on the eccentric rod, and overhead valves? No fear of noise, want of oil, or nearly so much wear.

(h) About carburetters. Some do not suit all machines.

Many do not work with benzole; few have petrol strainers, I say it is the duty of the carburetter to do the straining and keep the tank clear of such fitments.

(i) All leaks exist uncontrollable in the split of the induc-

tion pipe union, which is often clamped with a clip ring

and-screw,

(i) They are embodied in the air intake, which cannot be closed in many makes when starting from cold. I have put a cork in or fitted a trap door. A brass gazze diaphragm and flooding works well. But, after all, it is a ghastly waste of juice. My old Triumph starts when I need it with the contract of out flooding or priming. In the millennium each maker will produce his own carburetter with his mount.

produce his own carbinetter with his mount.

(k) Transmission. With a kick starter and clutch, either chain or belt, or both. The cheapest is the best. Scotland is bad, but try Cornwall! I had an endless belt once. It was topping for a few thousand miles. But if we must have ended belts, why not invent a fastener to tighten as

well as fasten?

(1) The cost of everything is simply outrageous—even lamps. Cannot a lamp be made of three or, at most, four stampings, fittings extra, and generator-half a dozen makers please note? A rooking price is as bad a defect as an inefficient article.

(m) Now we have discs everywhere. Why not disc wheels, and have done with spokes and the bore of washing

and painting them?

(n) Look at the little front brakes that continue to be issued. Surely the business end of the brake must grip on a belt rim of the right size to fit a front wheel, in ordinary spring forks without radical alterations.

I am aware that many improvements might be added to the list, but that can be better accomplished by your other correspondents with greater breadth of experience. But we find in these days that no machine embodies a large number (to say nothing of a complete number) of such refinements. C. ANDREW.

L.C.C. Index Marks.

The London County Council has been assigned the following additional index marks: XB, XC, and XD. This brings the number allotted to London up to twenty-four.

The M.C.C. Team Trial.

The course this year will be similar to that utilised last year. Consistent driving will be tested in the following manner: Each competitor must check his time for the first circuit, and must endeavour to make the two subsequent circuits as nearly as possible the same time.

Isle of Man Races.

It has now been definitely decided that the flying kilometre, race on the Douglas Promenade will take place on Friday morning, June 18th, owing to the fact that certain riders will not have access to their machines on the 16th, the date originally suggested.

Racing in New Zealand.

Ou February 7th the Pioneer Sports and Motor Club held a race meeting on New Brighton beach, Christchurch, the results of which are as follow:

FOUR MILES SOLO HANDICAP (Private Owners).
1. G. Henderson (7-9 Harley-Davidson) . scr.
2. W. A. Thrner (3½ B.S.A.) 60s.
Time, 5m. 58s.

FOUR MILES POST HANDICAP.
1. L. F. Poore (7 Excelsiot).
2. F. Haworth (7 Harley-Davidson).
Time, 3m. 57s.

How to tell the Date of a Harley-Davidson Motor Cycle.

All Harley-Davidson electrical machines, except those made in 1916, are prefixed by the letter L. When this is not the case the machine is equipped with magneto ignition.

For the year 1915 the number terminates with the letter K: for 1916, the letter N: the 1917 and subsequent models are prefixed thus before the ambor-L.17.T; 1918, L.18.T; or 1919, L.19.A; 1920, L.20.T.

L.19.A; 1920, L.20.T.

If any manufacturers like to send us similar information, which would be of assistance to our readers, it will be duly published.

Important South African Competition.

In the annual hill climb held by the Natal M.C., on Huntleys Hill, near Durban, F. A. R. Zucher put up the fastest time on his Douglas, thus winning the Douglas Trophy for the second year in succession. He covered the 600 yard course in 32½ sees. R. Ruzer, riding a Royal Ruby, was second.

Westmorland M.C.C. Open Hili-climb.

We have received a correction in the results of the above hill-climb held at Easter. In class 12 for 501 to 750 c.c. machines on formula, the results were: 1, B. Hill (3½ Scott); 2, J. H. Fox (5 Matchless). Jesse Baker, who was credited with first place, rode a 400 c.c. A.B.C., which, of course, was out of its class.

A.C.U. Consul's Badge

We reproduce on this page a photograph of the new consul's badge recently issued by the Auto Cycle Union. In future all consuls of the A.C.U. will display this badge on their machines, and will thus be readily recognised by members. Motorists displaying it are especially qualified and equipped to assist A.C.U. members, and have undertaken to do so within their respective districts.

The duties of an A.C.U. consul are many and varied. He is, for instance, at all times ready to assist members

Machine badge for A.C.U. consuls.

Special Features. ROAD TESTS OF NEW MODELS. LONDON-LAND'S END RESULTS.

regarding the selection, purchase or sale of a machine. He will advise them in any technical difficulties they may experience in the running or care of their motor cycles; or will, if circumstances require, make an expert examination and report upon any machine. The local consul will also assist members in legal, insurance, touring, and other matters.

The consuls are each responsible for a radius of about twenty-five miles from their respective local headquarters, additional ones being appointed in especially populous districts.

Second-hand Prices.

There is a noticeable increase in the number of second-hand machines for sale, which, at this time, seems to indicate that new models are now getting on to the road in some quantity. We saw quite a number of the very latest on the road during the Easter holidays. As might be expected, under the circumstances, there is a slight fall in second-hand prices generally, but no appreciable decline can be expected for some time to come

An Opportunity.

We have heard of a vacancy for a competition manager with a well-known motor cycle firm. The opportunity should be a good one for a well known and experienced competition rider.

Famous Italian Hill-climb.

Considerable excitement was caused during the big event of the Merluza hill-climb held recently. A. Trivellato (Harley) and Tuccimei (Della Ferrera), riding teather riding together, put up a desperate struggle for supremacy, Tuccimei leading well up to the first corner, but being steadily overhauled and beaten by the big Harley. The following were the winners in the variuos classes: 250 c.c., Motosacoche; 350 c.c., Douglas; 500 c.c., Motosacoche; 750 c.c., Motosacoche; sidecar class, Clyno; 1,000 c.c., Harley-

Trivellato covered the three kilometre course at a speed of 77 k.p.h. Last year he created a record by climbing this hill in 1m 59s., at a speed of 91 k.p.h.

Marylebone Town Hall.

Watson, Alderman Duncan J.P., M.I.E.E., Mayor of Marylebone, managing director of the Harley-Davidson Motor Co., Ltd. (England), had, at the recent opening of the new town hall, the honour of entertaining H.R.H. Prince Albert, K.G. Other guests of distinction entertained by the Mayor and Mayoress were Princess Alice (Countess of Athlone), Earl of Athlone, C.M.G., and Viscount Engages. Farquhar, P.C.

More War Honours.

The latest list of honours awarded to prominent figures in the motor cycle industry include the following:

COMMANDERS (C.B.E.).
Lieut.-Col. Claude Vivian Holbrook,
director Department of Mechanical
Transport, Ministry of Munitions, now
director of Triumph Cycle Co., Ltd. OFFICERS (O,B,E,),

Mr. Peter Frederick Blaker Bennett, managing director Messrs. Thomson-

Some of the "tit-bits" in the Western M.C.C. (Glasgow) Trial. (I) D.S. Alexander (23 h.p. Douglas) negotiating the watersplash (27 h.p. Dougras) negotiating the waterspission in Biggar. (2) An Indian rider amidst typical Scottish moorland scenery. (3) J. W. Walker (3) h.p. Norton) on one of the many hills included in the route.

Bennett Magnetos Ltd.; Mr. Geor Frederick Bull, managing direct Messrs. Chas. H. Pugh, Ltd. (Senspr. Carburetter); Mr. Stanton Wilding-Comanaging director Messrs. Burney a Blackburne, Ltd.; Capt. F. M. Gros aeronautical engineer, Siddeley-Dea Motor Co., Ltd.; Mr. A. P. Your. British Thomson-Houston Co.; and N. E. A. Watson, technical director M. Magneto Syndicate, Ltd. Magneto Syndicate, Ltd.

The London to Edinburgh Run.

The London to Edinburgh Run.

This year awards will be gold a silver medals, and no cups will be or tested. Those desiring to enter ment in their application forms membership to the Secretary, Mr. Sour comb May. 34, Gower Place, by first p. Tuesday, April 27th. Members must se in their entry forms to the trials he secretary, H. G. Bell, 77, Stapleton H. Road, Stroud Green, N.

Overtaking on Curves.

Not many weeks ago we uttered caution to novices on the danger of ov taking other vehicles on curves. Thad special reference to the chance meeting traffic which could not be se till too late. A case that recently can under our observation showed that the is not the only source of danger. empty sidecar overtook a car at a le hand bend, and not being able to round the slight curve at the pace it the road, crossed a piece of grass, at removed seven yards of oak paling The driver escaped serious injury, the outfit was badly damaged.

THE RE-OPENING OF BROOKLANDS.

Postponed B.M.C.R.C. Meeting held on Saturday.

Motor cyclists assembling for the first race in the atternoon

As if ashamed of its behaviour on Easter Monday, the weather, which had so effectively spoilt the meeting arranged for that date, provided ideal conditions for the five motor cycle matches run off on Saturday last, April

The first glimpse of the recently re-paired track, glistening in the strong sun-light, and the distant roar of the com-p. ting machines, revived fascinating thrills of the track after many years of anticination.

Thousands of Enthusiasts.

That the popularity of the classic sport continues could be observed by the

many thousands of racing enthusiasts and the long lines of cars and motor cycles on the course. The first race, for solo machines of any class, arranged to start at the Fork at 2 o'clock, was the Victory Handicap, in which a distance of 8 miles 842 yards was to be covered.

of 8 miles 842 vards was to be covered. The competitors passed the Fork twice, and then entered the straight to finish at the grand stand. Of the twenty-seven entrants, twenty starters got away well. Although not entered in the official programme, a very creditable start was made by Mrs. Longden, astride a 2½ h.p. Douglas. Rapid acceleration brought this lady well to the fore, but possibly the wind resistance offered by

her skirt spoilt her promising perform

her skirt spoilt her promising periomance.

J. Woodhouse on his Matchless, athough handicapped to the extent of 12 secs., rode well, whilst J. Emerson, astride a racing A.B.C., literally swallowed up the yards amidst a crackle from his twin exhaust pipes.

O. M. Baldwin on a Matchless had bad luck and dropped out on the second lap, as also did E. Kickham (Douglas), whilst momentary excitement was caused

whilst momentary excitement was caused by the premature appearance on the straight of S. F. Garrett (Indian). who informed a representative of The Motor Cycle that the plug of his front cylinder had failed.

J. Emerson (A.B.C.), who won the Victory handicap and the 500 c.c. sprint race.

Two Douglas entrants. Mrs. E. Longden was the only lady motor cyclist on the Brooklands course.

The start of the 1,000 c.c sprint race.

66 m.p.h. with 400 c.c. Engine.

From the start Emerson maintained a fast speed, and roared in first at the finish

tast speed, and roared in first at the finish well ahead of the runner up, W. A. Jacobs on a Singer, the former rider having lapped at 66.7 m.p.h.
Closely pursning, G. J. McIntosh (Singer) took third place, whilst running at a short distance from each other the following finished in the order named: H. R. Harveyson (Indian), V. E. Horsman (V. E. H.), H. Martin (Matchless), and T. Eve (Matchless).

At the finish, Mrs. Longden, who came in well, stated that the track was in places bumpy, otherwise it was a delightful race.

The 2.20 p.m. and 2.40 p.m. events were for cars competing for the Essex handicap, the details of which are described in our parent journal The Autocar.

Sprint Races.

The next race was a sprint of 3 miles 76 yards for motor cycles of a capacity

not exceeding 350 c.c.
Starting at the fork, the competitors covered one lap only, and entered the straight at the completion of the first lap. H. E. Wells (23 Douglas) got away

at speed, and held his pace, finishing little in rear of the winner, T. Eve, on a Match-less, who lapped at 54.2 m.p.h. Closely following came W. A. Jacobs,

on the Singer, securing third place, whilst E. Longden (Douglas) and A. F. Houlberg, on a new and shining Wooler, finished well.

The most enthralling race of the day then followed. J. Emerson (A.B.C.) and D. R. O'Donovan (Norton), two previous record holders on fast machines, were well in the running, and there was much con-troversy as to the likely winner.

Two Duzmo machines were entered, but did not start; equally disappointed were the admirers of S. L. Bailey (Douglas). O'Donovan well to the fore.

Eager faces strained to watch the two

Eager taces strained to watch the two likely winners, visible as two tiny specks in the distance. Slowly they crept towards the stand, O'Donovan leading, Emerson pursuing closely. It was but within 100 yards of the finish that the A.B.C. slowly trept up, the eager specta-A.B.C. slowly crept up, one eager specta-tors gripped the railings; and in a most exciting finish J. Emerson proved the winner. Well in the rear followed V. E. Horsman (V.E.H.), who was then con-siderably ahead of the runners up.

Emerson's average speed was 64.3 m.; The 1,000 c.c. sprint race was of an edistance to the foregoing. Star again at the fork, the machines enter the straight the first time they rear the starting point.

Victory for Eight-valve Engine.

J. Woodhouse on his eight v Matchless proved an easy winner, attained a speed of 75.9 m.p.h. over Iap. O. M. Baldwin, another Match lap. U. M. Balawin, another matter rider, followed, whilst third place secured by E. Remington on a J., engined twin, H. R. Harreyson, on Indian, following. The last race, ar good one, too, was a handicap for the wheeled cars and motor cycles with a cars of any class.

An 8 mile 842 yard course was cove three laps being completed before ente the straight. Three riders only faile start, and the first away, with 1m. start, was O. de Lissa, on a Motosac and sidecar, who secured third place E. B. Ware, in a barking little Mo

with a water-cooled J.A.P. eng started splendidly with a handicar 6s., and roared in at the finish, ahead of W. D. Hawkes on and Morgan. The latter rider was sec

Ware's speed per lap aged 59.5 m.p.h. E. C. Baragwan (Zenith) made good time the last lap, being for In this race, in w there were three Mor and five sidecars, O'D van seemed out of his ment, finishing slow rear of Baragwanath. finishing slowly

(Le't) E. B. Ware (Morgan) leading the field. He won the three-wheeler handicap.

(Right) T. Eve (23 h.p. Matchless) winning the 350 c.c. sprint race.

The Scottish Six Days Trial Routes.

New Ground for Competitors.

John-o'-Groat's Included.

FOR this year's Scottish Six Days, which will be held on July 5th to 10th, a series of new routes have been planned by the Edinburgh M.C. Briefly, the routes will be as follow:

First Day.-Edinburgh, Perth, Amul-

ree, Cockbridge, Inverness.

SECOND DAY.—Inverness, Abriachan, Beauly, Lairg, Tongue, Thurso, John-o'-

THIRD DAY .- Thurso, Wick, Golspie, Lairg, Inverness.

FOURTH DAY.—Inverness, Invernorriston, Clunie, Glenelg, Clunie, Tomdown,

Glendoe, Grantown.
FIETH DAY.—Grantown, Cockbridge, Pitlochry, Kenmore, Crieff, Stirling, Edinburgh.

SIXTH DAY.—Edinburgh, Elmscleuch, Redstone Rig, Stow, Edinburgh. On the first day the test hills will be Amulree, Cockbridge, and Bridge of Brown. Second day, Abriachan. No "special" test hills on the third day. Fourth day, Marruthachan and Glendowill be the test hills; on the fifth, Kenmore; and on the sixth Redstone Rig and Elmscleuch.

There will be special awards for single

gear performances.

A New Single-lever Carburetter.

Simple Variable Jet Control. Fuel Supply Proportionate to Throttle Opening.

THE production of a perfect mixture has, of course, formed the main consideration in the design of this carburetter, whilst, at the same time, the

buretter, whilst, at the same time, the cost of manufacture has received much attention in order to provide

order to provide both an effective and cheap device. A throttle slide, of the usual type, reciprocates in the barrel and is operated by a single Bowde on lever. Rigidly fixed to the bottom of the slide is a tapered needle which fits into the jet orifice.

into the jet orifice located in a brass tube screwed to the centre of the casting. By this arrangement, the lifting of the slide at the same time raises the needle, which consequently increases the size of the jet orifice, and produces a constant ratio of petrol and air at all throttle

Iones and Marchant's

carburetter dis-

mantled.

Easy Starting Device.

Another fitting which the inventors claim to be the most efficient of its kind is a special slow running and starting device. As may be seen in the illustration, a small hole A is drilled in the air intake and a similar hole is bored on the outside of the latter, which, with the orifice A, permits the passage of air to an annular slot cut round the jet tube in the mixing chamber. These holes are, at will, obstructed by a plunger operated

by the lever B. When the throttle slide is nearly closed and the hole A is opened, the induced air rushes, at a high velocity, over the aperture A, and causes a strong suction on the jet which produces a rich mixture. At larger throttle openings, the second hole, located outside the inlet pipe, comes into operation at atmospheric pressure.

Great Controllability.

During our trial run on an old and obstinate 8 h.p. twin, fitted with one of these carburetters, the docile manner in which it carried both rider and passenger up steep gradients, on bottom gear, at a speed less than a walking pace, effectively demonstrated the use of the plunger device. A touch of the throttle gave one an impression of the rapid acceleration possible under most strenuous circumstances. The facilities offered for adjusting the mixture, whilst in the saddle, need no comment. This can be done with greater accuracy than when the machine is stationary.

We have also tried the carburetter on a Blériot-Whippet light car, on which make it is now a standard fitment. It behaved remarkably well on this vehicle, giving ample acceleration and plenty of power, while the slow running was all that could be desired.

This carburetter is marketed by Messrs. Jones and Marchant, 1, Baker Street, Weybridge, Surrey.

AN AWKWARD PREDICA-MENT.

WHILE testing an automatic carburetter we had a curious accident the other day. The first time a long journey was taken over rough roads, and when about forty miles from the start the engine suddenly misfired and, made a peculiar noise, which led one to suppose that a valve had broken. Not anticipating that such a trouble was possible, as the speed had not been particularly great, and the machine in question was not given to breaking valves, we were not surprised to find that both valves were intact, and it was a few seconds before the trouble was located. It was then found that the carburetter casting was faulty, and that it had broken off close to the clip fastened on to the short inlet pipe.

Unfortunately, we had no insulating tape on board and no wire, but eventually we took a piece of rag from the tool-bag, wrapped it tightly round the fracture, and, after several attempts, succeeded in starting by placing the hand partially over the air inlet. The engine fired, and went off at a high number of r.p.m., and, owing to the inevitable air leak it was.

owing to the inevitable air leak it was, of course, impossible to throttle down. A garage proprietor, Mr. Carnegie, of Blindley Heath, was at first inclined to treat the repair as an impossible one: but, with a little persuasion, he quickly got to work, and fitted a couple of sleeves to give all the support possible to the fracture. The fracture itself was bound with insulating tape, and the carburetter was then scientifically wired into position by means of tough iron wire, which was first twisted round the air inlet, then wrapped round the nearest stay above it, to give vertical support, then brought round the cylinder, and twisted up as tightly as possible. Further wrappings of wire were then made round the portion which encircled the cylinder so as to get the maximum amount of tension, and on the second attempt the engine started, and the remainder of the journey, 150 miles in extent, was satisfactorily accomplished

AIRMAN ON THE ROAD

From Cockpit to Saddle

LYING, except for the select few, is now over, and the delirious thrills obtained during the war period by the thousands in the R.A.F. are a thing of the past. The joys of "aerobatics," performed upon a perfectly rigged 'plane with the engine tuned up to its utmost capacity, are now unfortunately few and far between.

Those dives upon the late enemy, with the Vickers

spouting death, every wire screaming, and the whole of the fabric of the 'bus threatening instant disintegration; those short and sharp, but distinctly sporting "scraps" among the clouds; and, finally, those blessed moments of repose between "stunts" which were, at that time, so much appreciated, are rapidly passing into dim memories.

Comparisons.

It is said-and it must be confessed, with a certain amount of truth—that it is difficult for an airman to give up flying. But 'planes are no longer avail-able for the thousands of demobilised pilots. They must seek new fields in which to obtain the modicum

must seek new fields in which to obtain the modicum of excitement, which is, to them, the essence of life. Previous to the war the majority of flying men were ardent motor cyclists; thus, being deprived of their latest love, they are naturally returning to their first. After all, there is a great deal of similarity between 'planes and motor cycles—both are capable of high speeds, both require skill to manipulate correctly, and both will provide an inexhaustible supply of real thrills. In fact, it must be admitted that the motor cycle in many ways provides more excitement than the aeroplane. At high speeds on the road it is fatal to allow one's attention to wander for even a fractional period, attention to wander for even a fractional period, while the apparent speed of a motor cycle is much greater than the plane, provided the latter is at any appreciable height. For example, 120 m.p.h. at 10,000 feet appears to be a mere crawl. It is only when landing or approaching another 'plane

travelling in the opposite direction that the enormous speed is realised.

On comparing the control of land and air machines, we find that it is necessary to balance a motor cycle, and to corner fast it is essential that the machine be leaned over to the correct degree if a spill is to be avoided. An aeroplane also has to be balanced, but in two directions at once, laterally and longitudinally. Both machines must also be steered, and both are extremely sensitive in this direction. When essaying turns in the air the correct degree of bank must be given in exact proportion to the acuteness of the turn. If too much is applied, the machine slips inwards, while if the turn is flat, the machine

slips outwards, and a wide turn is the result. When taking delivery of the new road mount the ex-pilot immediately notices the absence of the beautifully fitted up dashboard with its multitudinous collection of aero instruments, and for a while is conceive a very derogatory opinion of the humble ground slogger. Later, with the engine tuned up and run in, he realises that he has a most efficient substitute for his beloved "Camel" or "Snipe."

Sensations.

And when in mood an occasional "blind" on a fast machine up a steep hill is comparable to a "zoom," a rush down a similar hill on full throttle "zoom," a rush down a similar hill on full throttle (it all is clear) to a nose dive, a number of hairpins give the impression of a series of vertical turns, while even the "loop" is sometimes successfully emulated, albeit quite involuntarily. When on the road and the distant hum of an aeroplane comes down to earth, the motor cyclist becomes an airman once again. He almost invariably slows up to search the sky, and, having sighted his confrere of the air, his mind goes back to other days. Once an airman always are airman at least at heart an airman, always an airman, at least at heart.

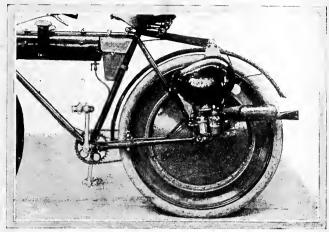

A Curious French Design.

An Auxiliary with Friction Drive

THE Fly-Voisin motor-propelled bicycle, which has just been put on the French market, has some rather unusual features. The rear wheel of the bicycle is changed for a disc wheel to bicycle is changed for a disc wheel to which a big diameter pulley is riveted. The engine is a single-cylinder Voisin two-stroke of 1½ hp., pivoted on the bottom rear extremity of the bicycle frame, and driving the rear wheel by means of friction. A coil spring tends to keep the driving pulley in contact with wheel effect is obtained by compressing this spring and slightly raising the entire engine and mechanism. A petrol tank is clipped into the frame, just below the top tube. With this engine it is claimed that a speed of sixteen miles an hour can be obtained:

The experimental model of this little cycle attachment was on view at the Paris Salon, but the design has been somewhat modified since that date. It will be noticed that a Zenith carburetter is fitted.

A motorised bicycle of French origin, possessing several unusual features.

CLUB NEWS:

Activities among Clubs and Results of Many Members' Competitions.

North Wates M.C.C.

A club has recently been formed with A cruo has recently been formed with headquarters at Denbigh, and the follow-ing officers were appointed: President, Mr. W. Edwards; vice-president, Mr. J. Bonner Thomas; treasurer, Mr. G. Jones; and hon. sec., Mr. S. V. R. Jones, 1, Ruthin Road, Denbigh.

Ealing and District M.C.C.

A hill-climb will be held on May 1st, about twenty miles from Ealing, on a hill the position of which will be made known later.

There will be classes for solo and sidecar motor cycles. Information can be obtained from the secretary, Mr. F. A. Longman, 17, Bond Street, Ealing.

N.M.C.F.U. (Coventry).

The annual general meeting was held on the 31st ult., when the business of the last year was discussed. The treasurer's report was interesting, and showed a balance of £40.

A run will be made to Bidford-on-Avon on the 18th inst., starting from Swan Lane, Gosford Green, at 1-45 p.m.

Middlesbrough and District M.C.C.

A blindfolded "starting up" competition was held after lanch on the petition was held after lunch on the occasion of the run to the Richmond Meet on Good Friday, the best times being made by F. Sheppard, 39s.; Dingle, 41s.; and R. Pickering, 42s. Later in the afternoon a speed-judging test was held over a 6½ mile course, resulting as follows: first, T. Wright (.3 m.p.h. error); second, E. Turnber (.7 m.p.h. error); third, W. Meyer (.85 m.p.h. error); error).

Mansfie'd and District M.C.C.

A general meeting will be held on the 26th inst., at 7-30 p.m., at the Masons' Arms, Leeming Street, Mansfield. All motor cyclists in the district are invited to attend.

Cork and District M.C.C.

A reliability trial was held on the 5th inst., from Cork to Glengarriff and back, a distance of 120 miles. The roads were good except near the finish, where a detour was made to include a stiff hill. Here several failed, while others made particularly good climbs.

Birmingham M.C.C.

The awards in the Sangster Cup Trial to Barmouth are now announced as under : to Barmouth are now announced as under: Sanoster Cup.—"W. J. Woodcock (3½ Ariel), CLASS A (Passenger machines above 600 c.c.).—Gold medal, "H. B. Denley (8 Morgan); silver medals, "L. Newey (6-7 Ariel se.), H. Bennton esc.), and "T. F. Walton (4 Norton se.); for a sec.), and "T. F. Walton (4 Norton se.); for a medal, "Howard R. Davies (6 A.J.S. sc.). CLASS B (Passenger machines below 600 c.c.)—Gold medal, T. Peck (3½, Ariel sc.); silver medals, (4½, B.S.A. sc.); bronne medals, C. Oerton (4½, Ariel sc.), J. A. Cole (3½, Sunbeam sc.), and H. C. Jennens (3½, James sc.), bove 600 c.c.).—Gold medals, A. Booth (5-6 Indian).

CLASS D, (Solo machines below 600 c.c.).—Gold CLASS, D, (Solo machines below 600 c.c.).—Gold CLASS, D, (Solo machines below 600 c.c.).—Gold CLASS, D, (Solo machines below 600 c.c.).—Gold

medal, A. Booth (5-6 Indian).

G. Orford (2½ Imperial).

AMATEUR PRIZE.—Gold medal, *H. B. Denley (8 Morgan).

* Made clean climbs of Bwlch-y-Groes.

Burnley and District M.C.C.

The following awards were made in the seventy-five mile reliability trial held on the 28th ult. Gold medal and prize for class over 770 c.c., won by J. Hartley (8 Royal Ruby sc.), 5\(\frac{3}{2}\) marks lost; silver medal, won by B. Cooper (8 Royal Enfield sc.), 8 marks lost; bronze medal and sc.), 8 marks lost; bronze medal and prize for medium weight machines, won by P. Duckworth (41 L.M.C. sc.), 9 marks lost; special prize for machines up to 770 c.c., won by W. Baker (6 Ariel sc.), 12 marks lost; special prize for lightweights, won by A. H. Thomas (23 Couleas B) with a cast 12 marks [23]. Coulson B), with a loss of 121 marks.

Dublin and District M.C.C.

In connection with the reliability trial held at Easter, the following results are announced: Dunlop Cup and sidecar prize, annonced: Dunlop Cup and sidecar prize, D. Allen (4 Norton); lightweight prize, Major J. A. H. Waters (2\frac{1}{2} Enfield); gold medals, P. H. Hurse (4\frac{1}{2} Enfield); gold medals, P. Sambeam), S. G. Smith (4 Norton sc.); silver medals, J. Browne (2\frac{3}{2} Douglas), J. J. Nolan (4\frac{1}{2} B.S.A. sc.), R. Howison (7-9 Excelsior sc.), W. J. Rumers (4, 2, Effeld a.) Burney (8 Enfield sc.).

Manx M.C.C.

The results of the Manx Club's reliability trial were as follows: Time

Club News .-

Warrington M.C.

A sporting hill climb is being held at Daresbury on Saturday, the 17th inst., starting at 2.30 p.m. There are five starting at 2.30 p.m. There are five solo events, three for sidecars, and one for light cars, making a very interesting programme.

North Lindsey A.C.

Starting from the Crosby Hotel, Scunthorpe, a very enjoyable run was made to Scamblesby on Easter Monday, to witness the hill-climb which was being held by the Lincoln A.C. (M.C.).

Despite the unsettled weather a good number turned out, which augurs well for the future of this recently formed club

Norfolk M.C. and L.C.C.

The following officers were elected at the first general meeting of the club since the war: President, Mr. W. IR. Spelman; vice-president, Mr. W. Lincolne Suttors; secretary and treasurer, Mr. C. Suttors; secretary and treasurer, Mr. C. N. Hurn; Captain, Mr. A. Adcock; committee, Dr. Blake, Messrs. R. O. Clark, G. Boswell, H. Chapman, M. Bagshaw, and F. Sexton; timekeeper, Mr. A. Wyatt.

Public Schools M.C.C.

A route-finding competition has been arranged for the 24th inst. Riders will meet at Bridge House Hotel, Staines, at 1.30 p.m., and will receive a paper giving instructions as to the route to be followed, also a sealed envelope containing the place of destination in the event of getting lost. Entries, with fee of 3s. 6d., must reach the hon. sec., Mr. H. B. Browning, by the 19th inst.

Members entering the London-Edinburgh run will be given consecutive numbers so that they can ride together. Entries should reach the hon. sec. by the 24th inst. The club will give a prize to each rider obtaining an award.

Scarborough and District M.C.

Among the classic events of long standing, the Scarborough Club's hill climb has always been a popular Yorkshire event. This year over ninety riders competed in the twelve classes. The results are now announced as follows:

peted in the tweive classes. Ine results are now announced as follows:
CLASS 1 (Scooters).—1, R. Cawthorne (2% Autoglider); S. V.
E. Grange (2% Autoglider). C. M. C. Carage (2% Autoglider). S. W.
E. Grange (2% Autoglider).
CLASS 2 (Lightweights up 2, 25 Cc.).—1, J. D.
Triumphl; 3, Riley (2% Triumph).
CLASS 3 (Lightweights up to 550 Cc.).—1, R. W.
Pickering (2% Douglas); 2, L. A. Ruuton (2% Wooler); 3, T. Twentyman (2%) Limond-Jap).
CLASS 4 (T.T. machines up to 550 Cc.).—1, R.
S. F. Seatle (3% Norton). A. Hall (3% Triumph);
CLASS 5 (T.T. machines up to 1,100 Cc.).—1, T.
S. F. Seatle (3% Norton); 2, N. Invinon (8 Indian); 3, W. Marriott (8 Harley-Davidson).
CLASS 5 (T.T. machines up to 1,100 Cc.).—1, C.
J. E. Seatle (3% Norton); 2, Thornton (7 Ariel); 5, C. Robinson (4 Norton).
CLASS 5 (Standard touring up to 1,100 Cc.).—1, E. Seatle (3% Norton); 2, Thornton (7 Ariel); 5, C. CLASS 6 (Standard touring up to 1,100 Cc.).—1, E. Seatle (3% Norton); 2, Thornton (7 Ariel); 5, C. CLASS 6 (Standard touring up to 1,100 Cc.).—1, E. Seatle (3% Sorton); 2, Thornton (7 Ariel); 5, C. CLASS (4) (Standard touring up to 1,100 Cc.).—1, E. Seatle (3% Sorton); 2, Thornton (7 Ariel); 5, CLASS 9 (Sidecar up to 1,100 Cc.).—1, E. Robavies (6 American Excelsior); 2, A. Shaw (8 Class 10 (Cycle cars).—1, W. Marriott (10 Grande Trix Morgan); 2, Miss Halliwell (10 Grande Trix Morgan); 2, Miss Halliwell (10 CLass).

Carden),
CLASS 11.—Withdrawn,
CLASS 12.—1, Douglas Pickering (19 Eric Campebill); 2, E. Macliwaine (10 Hampton); 3, J. Il.
Leunty (10 Calthorpe).
The fastest time of the day was put up by G,
Illi (Triumph), in Class 6—1m. 16]s. He wins
the Traumer Cup.

****************************** Grimsby M.C.C.

At a recent meeting of local motor cyclists held in Grimsby, it was decided to form a club. Mr. Peet c/o the Bend Cigar. Co., Victoria Street, Grimsby, will be pleased to hear from any riders who are interested.

Carmarthen M.C. and L.C.C.

An inter-club hill-climb was held on Good Friday near Pentrecourt. The course was about 1,100 yards long, and the surface was good. The following were the results in the five events:

CLASS I. (not exceeding 300 c.c.).

1. T. L. Thomas (2½ Eagle-Villiers) .. 1m. 50s.

CLASS II, (not exceeding 350 c.c.).

1. W. E. Bridge (2¾ Verus) 1m. 15s.

CLASS III. (not exceeding 567 c.c.).
1. Dr. A. Lindsay (3½ T.T. Norton) ... 593s. 49 £s.

CLASS IV. (Uulimited),
1. Dr. A. Lindsay (3½ T.T. Norton) ... 49ås
CLASS V. (Sidecars and Three-whoelers),
1. J. Thomas (Norton sc.) 1m. 18s.

Kiveton Park and District M.C.

A club to be known as above has been formed at Kiveton Park, near Sheffield. The secretary is Mr. C. Robinson, 1, Wales Road, Kiveton Park, Sheffield, with whom all who are interested should communicate.

Howden M.C.C.

An interesting course of fifty miles, including York and Garrowby Hill, was selected for the opening run of this new club. The winner was E. Featherstone (Triumph), while second and third places were second and W. Deitstein Hills. were secured by A. W. Bristoham (Rudge Multi) and B. Shaw (J.A.P.).

Stroud and District M.C.

The first annual dinner since the war was held at the Premier Café, King Street, Stroud. Forty-seven members were present, and it proved a most en-iovable and successful function, several new members being enrolled.

Lincolnshire A.C. (Motor Cycles).

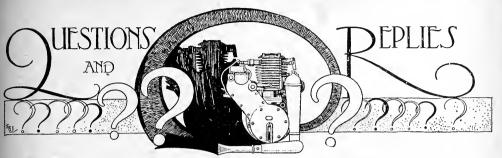

The opening event of the year was a hill-climb at Scamblesby on Easter Mon-The various events were well supday. The various events were well sup-ported, and a very enjoyable day was spent in spite of the heavy showers which fell at intervals throughout the afternoon. The 'results were as follow: Class up to 350 c.c., winner J. H. Brookes (Douglas); 500 c.c., 1. Kochler (Norton); 650 c.c., J. S. Plastow (Triumph); unlimited class, L. Forinton (7-9 Indian); sidecars unlimited, A. W. Grocock (8 Zenith sc.), L. Forinton made the fastest time of the day.

North London M.C.C.

The inclement weather failed to damp the spirits of the members who attended both Easter events. The slow climb held on Saturday at Northlaw was very keenly contested, the winners being A. J. M. Ivison (4 h.p. Douglas sc.) and S. F. Colman (4½ h.p. James). The Captain's surprise event on the Bank Holiday took the form of a run to Tring, at an unknown schedule speed. Again Colman was the winner of the club prize, being nearest to the pre-arranged schedule

Another photograph depicting public interest in motor cycle events. The scene was at the recent Staxton Hill climb, and shows the crowd of spectators assembled at the worst bend of the hill.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand comer of envelope, and should be kept distinct from questions bearing on technical subjects.

Capabilities of a Two-stroke.

(1.) I require a machine mainly for business purposes, but should like to get out on it at the weekends into the country. Do you take such hills as are encountered in Cheshire and Wales? (2.) What is, in your opinion, about the mileage to the gallon? I should think ahout eighty or ninety miles. What speed should be obtained on the level? (5.) Can a kickstarter and clutch be fitted to a 23 two-speed two-stroke?—L.G.B.

(1.) If fitted with two-speed gear a 23 h.p. two-stroke machine should be capable of climbing any of the hills you would meet when touring in North Wales. (2.) 80 or 90 m.p.g. is a good average consumption for a 23 two-stroke engine, and 55-40 m.p.h. might be attained on the level. (3.) A two-speed gear box incorporating clutch and kick starter can be fitted.

Building a Wind Waggon.

I have been contemplating building a wind waggon for the last four years, now I mean it in earnest, having read your recent entitle on the subject. Will you kindly give me some idea as to the following items: (1) To what firms should I apply for a propeller, say, about 4ft. 6in.? Should it be four or two blade? (2.) What would be the maximum revolutions for a propeller this size without air slip? (3:) Would a 10 h.p. twin engine be strong enough, and would you advise direct coupling or geared up or down?—J.S.B.

(2.) We should recommend that you obtain copies of the technical journals devoted to flying, where you will find the advertisements of several makers of propellers, any one of which would no doubt meet your wishes. (2 and 5.) The answer to both these questions entirely depends upon the type of propeller selected. In our opinion, the best thing would be to decide on, say, a 10 h.p. engine, ascertain its normal revolutions per minute, and, armed with this information, approach the propeller makers who, with these data, could design you the most efficient type. Alternatively, if you obtain the propeller first, the manufacturer could inform you of the power which would be required to drive it at its most efficient speed.

Noisy Machine.

I have a 1913 CampionPrecision 44 h.p., and whilst out
riding I had the misfortune to
lose the ends of the silencer. I
have fitted two ends, made of
tin, sheet iron. The machine used to
run fairly quietly, but now the explosions seem to be much louder. Should

rim larry quiety, but now the explosions seem to be much louder. Should there be any fittings inside the silencer to deaden the sound? If so, please inform me what they are and where I can obtain them. Can you enlighten me how to get the machine to run more silently?—H.S.

We are of the opinion that the extra noise made by your engine is caused by the "ringing" effect produced by fitting a thin sheet metal end instead of the thicker cast ends which are fitted as standard. There are no internal baffles in the silencer fitted to your machine, and you can overcome this difficulty by fitting thicker ends and running a pipe with a fish tail end from the silencer to the rear of the machine, supporting it from the chain stays.

Using an Old Frame.

I am in possession of an old type Quadrant loop frame, and am desirous of fitting an engine into it of 3½ or 4 h.p. Can you inform me of any makes of fairly up-to-date engines (with magneto ignition) which would suit it? The only one which has been suggested to me is the ancient côil ignition Quadrant, which, of course, is out of consideration. —C.G.G.

The best thing you can do would be to obtain a 5½ h.p. engine to your own liking and then have the frame altered by some good mechanic to take this engine. In the majority of cases, it will simply mean cutting the frame and brazing the lugs on to the end of the engine and seat tubes, and then fitting a pair of suitable engine plates, in order to carry it. We feel sure that this will be a better solution to your difficulty than endeavouring to find an engine which will actually fit your loop frame, as you might experience considerable difficulty in so doing.

M.C.C. LONDON - LAND'S END COMPETITION.

A picturesque scene on Parracombe Hill. J. A. Masters (7-9 Harley-Davidson) going well

MOTOR (YCLE

Removing a Pulley.

I am overbauling a Swift 32 h.p. motor cycle, Ariel engine, 1912, and find great difficulty in removing the crankshaft pinion wheel which actuates the valve timing gear. A Mabon clutch is fitted, the inner flange of the pulley being just as obstinate as the pinion. Would you be kind enough to advise me of the best method of removing each or either of the above parts?—W.H.A.

The trouble you are experiencing in removing the centre timing pinion is very common on any engine which has not been down for some considerable time.

It may be very carefully levered off by means of two small levers exactly opposite each other, but great care must be exercised when utilising this method. Any garage of repute would be able to loan you a special tool which would draw this pinion off without the possibility of causing any damage. With draw this pinion on without the possi-bility of causing any damage. With regard to the pulley, if the nut which holds it on is loosened, say, three or four turns, and the whole crank case assembling held up by means of the pulley itself and a sharr tap given to the end of the engine shaft, the pulley should become loosened. Here, again, great care must be taken not to damage the shaft or pulley. If there is a real first-class engineer in your town, we should recommend that you allow him to do this, as no doubt he would charge very little.

A Damaged Machine.

I have a 1918 machine, and owing to the low gear not engaging properly I took it to a repairer to have it put right, and, to eatisfy myself, had the gear box taken down and examined before Dox taken down and examined before I left, and it appeared all right, with the exception of adjustment. As he could not finish the job that day I was to call for it on the Saturday, but did not do so. On the Sunday, apparently, a mechanic took it out, and had an accident, considerably damaging the machine. I happened to go to letch the the Monday as it was being the machine. the hadrine. I happened to go o feet, it on the Monday as it was being brought in, and attached to the machine was a label showing it had been brought —damaged—by train from a station twenty-two miles distant. The pro-prietor of the garage cays I asked his mechanic to test the motor cycle, which I absolutely deny, and in so doing the right-hand fork broke at the slot, which right-hand fork broke at the slot, which fits on the whicel spindle, thereby causing the accident. When I examined the broken part it had not a flaw so far as I could see. I believe it is a case of joy-riding. Those are the facts. Under the circumstances, what advice can you give me?—W.B.

Undoubtedly, there was no necessity for the mechanic to take the machine such a considerable distance for the mere purpose of a test, and we should therefore suggest that you see your own solicitor regarding this. Without close personal examination, it is very difficult for us to give a depend-able opinion; but, from the facts you have mentioned, we should say that you have quite a good case for the recovery of the cost of repairs, etc. It is very difficult indeed to give opinions in cases like those, as so much depends on the existence of witnesses, etc.

EXPERIENCES WANTED.

"C.T.E." (Salisbury Plain). — Binks carburetter on 3½ h.p. Rudge Multi, more particularly most suitable jet sizes.

"F.D." (Kingston).—Binks carburetter on a single geared 24 h.p. Levis. Advantages over standard carburetter as regards power and economy.

READERS' REPLIES.

Occasional Stopping of Engine.

A recent correspondent, J.H.N., com-plains that he has had some trouble with his machine slowing up, and yet it will immediately start again. I once had the same trouble myself with my machine, a 3½ h.p. Bradbury and sidecar. It occurred some seven or eight times in a mile or so, and I was at a loss as to the cause, for the engine would immediately start again first kick. At last, however, I discovered that it was nothing more nor less than the skirt of my coat occasionally getting over the air inlet of my carburetter and being held there by suction. EN 1168.

Two-stroke Troubles.

I notice that several of your readers have had trouble with their two-stroke engines falling off in power. I own a Royal Ruby lightweight, fitted with a Villiers mark I engine 1914. I found that it was fairly fast on the level, but slow on hills. Suspecting back-pressure, I drilled the silencers, and the result the benefit all coverate in the result with the strong strong the result with the strong strong the result was the strong strong strong the result was the strong strong the strong stron I drilled the silencers, and the result was beyond all expectations. It now flies up all hills, and is plenty fast enough on the level, with the roads as they are now-a-days. I also get easier starting from cold. Of course, it makes more noise, but it is no worse than many other two-strokes. I also find oil consumption is much less. Perhaps this tip rould be result to other readers. this tip would be useful to other readers (if they do not object to a little noise), if you could find room in your valuable space to publish it. L. R. King. space to publish it.

RECOMMENDED ROUTES.

NEWCASTLE TO RUSHDEN (NORTHANTS). _T.R.

Newcastle, Durham, Darlington, Northallerton, Boroughbridge, Doncaster, Ret-ford, Newark, Grantham, Stamford, Norman Cross, Huntingdon, Buckden, Kimbolton, Higham Ferrers, Rushden. Approximately 210 miles.

MOTOR CYCLES FOR SALE

Triumph.

19 15 Triumph, 3-speed S.A., overhauled, r. ennuefled, new tyres, 2 lamps, born, Sterlishields; 285, offers.—Edwards, Ash Vale, Surrey.

TRIUMPH, 4¼h.p., 1918, guaranteed, 3 countershaft, perfect order, good conditional lamps; £85.—Jagger, Claughton St., Kiddern

19 13-14 3½h.p. Triumph, S.A. hub, Bosch sidecar, Easting, Klaxon, lamps, accur £100, lowest; London.—Box 3,009, c/o The Moto

LATE 1913 Triumph, 3 speeds, clutch, Klaxon, Cowey speedometer, tools, unused war; £56, bargain.—72, Longridge Rd., Earls

TRIUMPH 31/sh.p. and Wicker Sidecar, N.f. speed, excellent running order; price 40 Birch, 27, Werrington Rd., Bucknall, Stoke-or

TRIUMPH Countershaft Combination, new 1919, luxurious bulbons sidecar, perfect 2130, or near,—60, Wallingford Av., North Ken

TRIUMPH 3½h.p., Grado gear, K.S., excelled dition, new lamps, horn, belt, tyre, etc.; ar £42, no offers; evenings. 65, Silverdale, Sys. E. £55.—Triumph 1910 31/h.p. combination, wiel car, been overhauled by makers, Roc ger fect running order; bargain.—Tye, Barnby Mo ford.

1919 Triumph (October), complete with 1921 gomery sidecar, spare belt, horn, etc., c as new; £140, or near offer.-11, Dover St.,

TRIUMPH 1914 4h.b., 3-speed, clutch, sidecar, Lucas King of Road lamps annew tyres, tubes, and spares; £85.—Phone Hop.

19 19 Triumph, 3-speed, latest gear char-cellent condition, Mead and Deakin sidecar; £130.—King, 13, Hope St., Mill Re bridge.

1920 Countershaft Triumph, with Sandum back sidecar (blue), with hood and screet new, delivered March 31st; offers?—26, Mor Royston, Herts.

TRIUMPH Combination, 1914, with 1918 b ford sidecar like new, Sturmey 3-speed, Immps, tools, excellent running order; £80,-1, Rd., Dulwich, S.E.

10 12 Triumph, fixed, in guaranteed order, and plate good, semi-T.T.; any trial cination; price 248.—G. W. Green, Millgate, Yorks. Tol.: 36.

TRIUMPH, TT., 3½h.p., dropped frame large tank, lamps, generator, pump, to-good order; £48, or near.—Meadows, Abbots; Rugeley, Staffs.

Rugeley, Stans.

TRIUMPH 1913-14 3½h.p. Combination, cluster, N.S.U., 2-speed, splendid conditionent running order, all accessories; £65,-22, Rd., Hornsey, N.

TRIUMPH Coachbuilt Combination, 4h, model, drip feed, 5-speed gear, clutcused, lamps, etc.; hargain, £87/10.—174, 1Av., Streatham Hill, S.W.2.

19 19 Triumph Combination, Gloria, hood, apron, T.T. handle-bars, P. and H. Horn, tool kit: £140, or nearest.—Thone: Mo Homewood, Hampton, Middlesex.

TRIUMPH, 1913, with 1915 4h.p. engine, N.S.U., tyres and machine in real goo tion; £65, or near offer.—Write, G. S. Ricki ham Garage, Barnham, Sussex.

TRIUMPH Junior, mileage about 250, un and not fully run in, no nunctures, hot tools and repair kit, ideal little mount; lower D. Lavin, Old House, Sonning, Berks.

1913-4 Triumph 34/h.p., 3-speed, clutch, 6 tern wicker sidecar, door apron, tyres goonly 400 miles), 2 lamps, born, excellent of £65.—Harper, Oxford, near Sevenonks.

TRIUMPH 31/3h.p., 2-speed, clutch mode mag., all tyres new, accessories, Lucar speedometer, complete tool kit, ready to the £55.—C/o Freeman, Brighton Rd., Redhill, S

TRIUMPH, late 1014, 3-speed clutch, ki just overhanded and painted, all in perfection, complete with lamps and mechanical horizontal action, 270,-H., Lyndhurst, Woodhonse Rd

1913-14 Triumph C.B. Combination, S.A., clutch, kick start, mechanical horn, lig complete, tyres sound, back new, guaranteed is out; 75 gns.; private owner.—Sen 173, Kin Kingston, S.W.

4 h.p. Countershaft 1917 Triumph Combins distinguishable from new, guaranteed hand new puryle sidecar, hulbous hack, fine seen and tried any time; best over £100-21, Norlok Rd., Littlehampton.

19 19 Triumph, countershaft, fitted wit G mauve siderar, Lucas light car dynamode set. Easting wind screen, spare valve, toolstall 650, as new throughout: £157—Wilcox, 1] It stead Rd., Handsworth, Birmingham.

Unfair Taxation.

Y the time this issue of The Motor Cycle is in the hands of the public, the Chancellor of the Exchequer will have placed his Budget proposals before Parliament. How these proposals are likely to affect motor cyclists has been fairly well known for some time and confirmation is to hand in the interim report of the Committee appointed by the Minister of Transport.

Elsewhere in this issue we publish a letter from the Secretary of the A.C.U. giving the views of that body on the proposals. We know that both the A.C.U. and the Union representing motor cycle manufacturers have been closely in touch with the Committee mentioned above, but a glance at the list of gentlemen constituting it shows that motor cycle interests were not directly represented. It would appear that, despite the fact that motor cyclists are more numerous than car owners, they have apparently been treated as an auxiliary section of the public sufficiently important to contribute to the cost of the roads, but unworthy to have a place among those organisations representing car and motor fransport interests.

No Rebates for Old Machines.

It may be only incidental, but it is significant that when once the question of a fuel tax had been definitely vetoed by the Government, the attitude of the A.C.U. and the Manufacturers' Union, acting in an advisory capacity to the Committee mentioned above, appears to have been one of resignation. The proposals (30s. for solo machines under 200 lb., £3 for solo machines over 200 lb., and £4 for sidecars and three-wheelers) appear to have been put forward by those who are supposed to represent our interests. The Secretary of the A.C.U. states that the A.C.U. alternative to a fuel tax was compound taxes of 30s., 55s., and 75s. respectively, or 5s. less in the two latter cases than the final recommendations of the Com-

mittee, and in the case of motor cycles there is apparently no allowance for old machines.

It has long been recognised that increased taxation is inevitable, but increases of 300% in the case of passenger machines and 200% in the case of solo machines over 200 lb. are too much, especially as the revenue so obtained is to contribute towards the cost of repairing roads damaged during the war, when the majority of motor taxpayers were not allowed to use them.

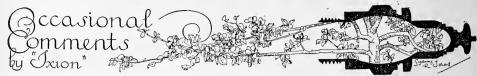

Quarterly Payments.

The report distinctly states that the option of quarterly payments is offered to car owners only. Could anything be more unfair? The motor cycle riding public are in greater need of facilities of this kind than the wealthier classes owning cars. This must be remedied, as must the non-provision for old-type motor cycles.

265,000 motor cyclists are expected to contribute £850,000 as against £3,300,000 expected from 210,000 car owners. This means that motor cycles are supposed approximately to do damage to the roads one-fourth the amount estimated for cars.

In finding a basis for these suggestions, those concerned have been unfair to the lightest forms of motor vehicles, for no one can assume that the total weight of all the motor cycles on the roads is anywhere near one-fourth the assumed total weight of private cars. This is not taking into consideration that a vehicle weighing a ton will do a great deal more damage than four motor cycles.

If we take this argument a little further in conjunction with the estimated Budget, we may compare the possible damage to the roads by 265,000 motor cyclists (fully half of whom only use their machines at the week-end) and that of 100,000 commercial vehicles, the majority of which weigh many tons each, and which are only required to contribute £2,190,000. It is these very vehicles that do the damage to the roads.

Lighting for Short Runs.

RURAL rider implores me to stir up the trade in general, and inventors in particular, with regard to a system of motor cycle lighting suited to short runs. My correspondent, like thousands of riders, lives in the country, half a dozen miles from town, station, and shops. To such, a motor cycle is an incredible convenience. His brief flips to some neighbouring hub of civilisation tot up to a dozen in a week. In the absence of a motor cycle they would have to be performed on a pony, or a cycle, or in a trap, and the mere journey to and fro would occupy an hour, or an hour and a half. By motor cycle each trip absorbs about twenty minutes in pure travel. But here's the rub. The motor cycle journeys must be performed by day, unless the machine is to be a regular nuisance, and most rural residents get their leisure in the evening. There are at present two lighting systems which are absolutely as convenient and efficient for a ten minutes spin as they are in a London-Exeter-dissolved acteylene and the electric dynamo. I have recently given prominence to the factors which restrict the vogue of gas cylinders, and we all know that dynamo outfits are costly, by no means easy to procure with new machines or to fit to old machines, and possibly in some cases not yet wholly trustworthy. The other alternatives are three in number:

(1.) Gas generators (messy, troublesome, and expensive in short distance use).

(2.) Oil lamps (too dim). Dry battery outfits.

The last system appears the most promising for the sort of rider who takes a couple of five-mile spins most evenings, but I cannot unreservedly recommend it on my own experience. I have found the head lamp batteries too short-lived for economy. Can others give a more hopeful narrative? In any case, the standard motor cycle is in urgent need of a lighting outfit which gives the same excellent service on long trips and the same delicious convenience on short spins as a ear dynamo set affords.

Scott Petrol Consumption.

RECENTLY referred to the Scott as having "the thirst of an Irish navvy," and this dietum has · brought "Wharfedale" and others on my track. I hasten to state that the remark was uttered in a purely Pickwickian sense. Everybody knows that two-strokes are, on the average, thirsty fry: it is the price one pays for their many delightful qualities. "Tim" Wood estimates the average consumption of a solo Scott as 70 m.p.g. "Wharfedale" is proud of getting 57 m.p.g. on benzole with a sidecar. sidering that a Scott gives us four-cylinder manners with a power unit which is simpler than a singleeylinder, these figures are not at all bad. comparatively, they are poor, as nearly all two-stroke economy is poor when contrasted with four-strokes.

For example, the Triumph sidecar in the A.A. benzole tests did 84 m.p.g. and my own T.T. Norton solo does 110 m.p.g. I once heard a matter-of-fact Saxon tell off a Welshman by informing him that "he would weep at the sight of Snowdon, but was totally immune from anything that could be called principle." all have the defects of our qualities, and motor cycles are not exempt from the law.

Starting a Scott.

RIEND "Wharfedale's" wrinkles on starting a Scott engine are what I have employed from the commencement of my ownership, except that as my own engine was delivered with one or two mino: air leaks, I found that a cork in the air intake acceler ated the "half dozen lazy digs" method until sucl time as I had eaulked the faulty points. "Wharfe dale" did not quite grasp the point of my enquiry which related to two Scott machines, which in my pre-Scott days I had repeatedly seen start up from cole with but a single dig at the starter. This mystery i now explained by the owners concerned, both of whon use Euk starters (a pump which sprays the petro injection). In one case the Euk is connected to the induction pipe, which, as "Wharfedale's" notes sug gest, is apt to create a fresh source of air leakage In the other it is coupled up to a cock in the cylinde head. The "one-kick" start can only be attempted without risk to the kiek-starter, when the brand and the quantity of the lubricating oil do not producgumminess. A "two-kiek" start from cold is good enough for anybody, and better than many four-stroke achieve in winter weather on current fuel.

The Champion Rider.

THE suggestion to identify our champion moto evelist is timely and interesting, but its organisation will present some thorny points, none of them perhaps insoluble. Here is an illustration. It company with many other critics, I always considered that the late Ivan Hart-Davies (killed in an aeroplanerāsh at Northolt) was facile princeps at ordinary road He picked a good machine, tuned it ad mirably, rode it with splendid judgment, and was a sound in a Six Days as he was unapproachable ove the End-to-end course. But he was quite second rat when it came to real speed, and never did much i a timed hill-climb, or on Brooklands, or in the T.T Men like another dead R.F.C. pilot, Oliver Godfrey and others we can all name, were in a different class at maximum speed work, Hart-Davies's forte bein prolonged moderate speed. It would be difficult to frame a scheme which would do justice to both types The problem may be solved by the appearance during 1920 of a man who can win the T.T., put up new End to-end figures, and also score heavily in the big legal limit reliability trials. If such a rider exists, his claim to the absolute championship would be unquestionable But in the past we have more than once had un

ccasional Comments.-

rowned kings in each separate branch of the sport, iz., reliability and speed. Under a single scheme here would be some risk of the championship falling of a man who has just failed to top the tree in both lepartments, and had to acknowledge a superior in each. In that case it might be better to divorce the wo branches and have separate championships for acing and reliability.

Survival of the Fittest.

NNING the various buyers' guides published in this journal and its associates, I noticed that there are now on the market some seventy lifferent makes of lightweight motor cycle, some eventy different makes of water-cooled light car, and bont thirty different patterns of cycle car. All these pecifications are aimed at the man of strictly moderate neans, and as such, "built down to a price." normal times it would, of course, be insane to split ip the supply of so limited a demand among so many ival specifications; most of them would necessarily be manufactured on uneconomical lines, and would cost a great deal more than if the total output came rom a lozen scientifically laid out factories with big outputs. It follows that a good many of these nachines will die early deaths.

Undershields.

NE is driven to the conclusion that many of our big makers have never made comparative tests of (a) a machine fitted with plain footrests and the ordinary or tape type of front mudguard and (b) a machine fitted with footboards and side-splashers to the front guard. (It is quite a simple job to design the latter accessories to be instantly detachable, thus converting the machine back to T.T. outlines in I have a sample of each pattern in fine weather.) The former brings me home in bad my garage. weather in such a condition that it would pay any allotment holder to scrape me down from the knecs to the bootsoles: he would get about half a barrowful of excellent loam. The latter machine restores me to my family in drawing room order, unless I have been tempted to exceed the speed limit on a windy day, in which case cross breezes may perchance flick a few spots of mud on to the sides of my trousers below the knee. I suggest that the standard outfit should include some front fittings of the Scott splasher or College legshield variety, plus an undershield of the Cedos type; and that a narrow front mudguard and naked footrests should be a special T.T. option. But when I enter the trade, I shall equip my stock machine with all the lot, and the mud protectors will snick off on request.

THE PREMIER RUNABOUT-A THREE-WHEELER WITH A REVERSE GEAR.

THE PREMIER'S SALIENT FEATURES.

ENGINE: V twin, water-cooled; 80 mm. bore; 105 mm.; stroke: 1.055 c.c. capacity; mechanical lubrication.

TRANSMISSION: Shaft to gear box, three speeds and reverse; final drive by one duplex chain, enclosed.

FRAME: Pressed steel.

SPRINGING: Quarter elliptic.

TANK CAPACITY: Five gallons. WEIGHT: 7 cwt. approximately.

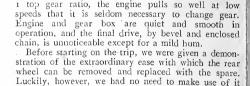

PRICE: £260, fully equipped.

IGNS are not wanting that the three-wheeled runabout will in future loom large in the purview of that class of motorist who desires the most economical form of passenger motor cycle.

Taking over a Premier super-runabout on a Saturday morning, a sixty-mile trip was arranged that

Almost directly after the start rain commenced to fall in torrents, and we were obliged to put up the hood, a simple enough procedure, but one which the writer cordially detests, since enclosed driving is

always distasteful Good to him. roads were the order of the day, and the little threewheeler hummed along in a most delightful fashion. The water-cooled V twin engine is wonderfully balanced, and was hardly distinguishable from a four at any speed above 12 m.p.h. Not only is there no perceptible period at road speeds, but, in spite of the 4 to в6

throughout our trial. On the following morning we

set out for Cheltenham via Warwick, Stratford, Broadway, and The run combe. was uneventful, and the machine ran like `clockwork. After lunch at Cheltenham the rain once more descended, but we clung to our original intention of climbing Birdlip Hill, and consequently set out along the Painswick road.

> The writer had not visited Birdlip since pre-war days,

Externally the Premier design is commendable; there are no unsightly excrescences to mar its "clean" appearance.

Road Tests of New Models .-

and found two deep ruts on the hill, while the surface was greasy but fairly good.

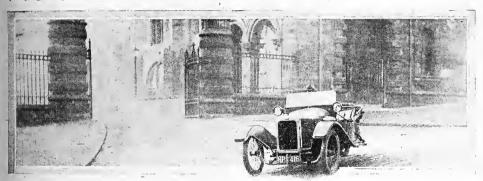

A straightaway run at the hill brought us well up the first steep rise on top gear, and an early change to second carried us to the knap. Here the low gear was engaged, and though there is little doubt that we could have got back to middle for quite a long period, no change was made. Near the summit the throttle was opened up, and the speed never fell below 11 m.p.h., a good performance for a well-loaded engine of under 1,100 c.c. The homeward run was marred by a heavy storm, and some delay was caused in rendering aid to a motor cyclist who was held up by a broken sidecar spindle.

Throughout the trip no tools were touched, and the engine and transmission behaved most satisfactorily.

Springing is always a difficult problem in a light machine, especially if it be a three-tracker, as light springing is apt to cause a roll, and harsh springing is, of course, uncomfortable. In the case of the Premier a compromise has been struck which is, in our opinion, capable of improvement, but we understand that this question is engaging the attention of the designer, and a modification is expected.

The steering is by rack and pinion, and, though extremely light in operation, conveyed to us the impression that it is rather too direct. Speaking generally, the machine handles well on all but bad roads, and the tendency to tail-wagging, common to most three-wheelers, is present, but not unduly pronounced.

Gear changing, once the knack is acquired, is simple and quiet, and the brakes are powerful and smooth in action. Fully equipped with hood, screen, spare wheel, and Lucas dynamo lighting set, the Premier is a very taking proposition, and should make considerable headway when production starts, and we should like to congratulate the designers on overcoming successfully the difficult problem of making a three-wheeler look really attractive.

One of the features of the Premier is its reverse gear, which greatly facilitates driving in towns or narrow winding lanes

SIDECAR STEERING.

Notes on the Easy Control of a Rigidly Aligned Sidecar Outlit.

PROBABLY few vehicles possess the power of "'self-steering' to the same extent as a well-aligued sidecar outfit.

The writer has latterly been experimenting with a machine fitted with a particularly satisfactory chassis coupled up by connections permitting no variation other than a slight adjustment of the motor cycle from the vertical position.

On long journeys this machine may be said to steer itself, and is particularly effortless to drive. With the erown of the road between the wheel tracks, i.e., directly under the sidecar body, the outfit travels ahead in a straight line. On the left camber of the road it runs to the left, and on the right side it at once tends to incline in the same direction.

Taking Advantage of Road Camber.

The amount of drag in either case is so slight that a single finger on the grip will correct the steering, and there is no feeling at any time that the machine must be wrenched back into the middle of the road.

By taking advantage of these tendencies, the outfit may be made to go round all ordinary corners without violent steering. Hugging a left-hand bend, and "cutting" one to the right (when the road is clear), will ensure absolutely effortless cornering. The "self-steering" effect may be greatly enhanced by judicious use of acceleration and deceleration. Thus, by approaching a left bend slowly, and increasing the throttle opening all the way round the bend, the machine tends to "run round the sidecar wheel," using the latter as a pivot. On a right-hand corner, a reversal of the process is necessary. By decelerating on the approach of a right'bend, and braking if necessary, the sidecar wheel tends to overrun the cycle, thus turning the outfit to the right.

A brake on the sidecar wheel, in the writer's opinion, if used with caution, should greatly facilitate left-hand cornering. The above noted effects are almost entirely due to the unalterable attachment of the sidecar and to a slight outward inclination of the motor cycle from the vertical.

WHARFEDALE.

CLASS D. For motor bicycles of which the cylinder capacity does not exceed 750 c.c.

The whole of the records in the above Class C also apply to Class D

The schedules given below show the records on April 3rd, 1920. Preparations are in hand for assaults on these figures: which will be the first record to be broken?

CLASS E. For motor bicycles of which the cylinder capacity does not exceed 1,000 c.c.

Y experience of a wide range of engines of varying powers that have been used in aeroplanes and of experimental work carried out in connection with them, has convinced me that air-cooling has great possibilities for motor vehicles of all kinds. It has, of course, been proved a success on motor cycles for years past; its extension to larger vehicles is now the subject of much experiment. It seems to me to be the duty of engineers to endeavour to reduce the cost of motoring; and, as I can think of nothing more, likely to help to this end than efficient air-cooling, I am auxious that the knowledge available should be as widely spread as it can be.

The Motor Cycle has two outstanding advantages for publicity, for 1 admit freely that in this matter 1 am a propagandist. The first is that I believe it has the largest circulation in the world of any technical journal, and the second is that it is read by the most enthusiastic engineers, amateur and professional, of what I consider to be still the foremost engineering country of the world.

Past Achievements.

One word of warning I should like to utter. In the course of these notes I shall find it necessary to condemn much that is present-day practice. I do not wish it to be thought that I am suggesting that at the time when many of the motor cycles now on the market were designed it was likely that anyone, least of all myself, could have designed anything more serviceable, neither do I pretend that it would be sound

policy to stop manufacturing tried and trusted designs All that I hope is that engineers of our established motor cycle firms will persuade their directors that considerable improvements could be made in certain respects, and that the final result when offered to the public is likely to compensate for the time and mones spent in experiment to determine whether or not the present designs should ultimately be altered.

Valuable Data

First of all, I want to advise all who are interested in the subject to read, learn, and inwardly digest the paper read by Dr. Gibson to the Institution of Automo bile Engineers on the air-cooling of engines. paper was reported in The Motor Cycle on Februar 5th.) The information in this paper was obtained by an expenditure of time and money that is likely to be beyond the means of even our largest moto cycle manufacturing concerns, also it is unlikely that the services of so eminent a man as Dr. Gibson would be available except under the peculiar circumstances o the world war. This paper contains a record of experi mental work carried out with scientific accuracy on air cooled cylinders of bores varying from 4in. to 8in. i diameter, with bore-stroke ratios of from 1 to 1 to 1 to 1.4. These cylinders were tested under all sort of loads in draughts of air from 90 m.p.h. down to no draught at all. Horse-power, petrol consumption and temperatures of cylinder, and piston and exhaus valves are all recorded, and the effect of mixture strength, and ignition timing is also noted. The accul-

Air-cooling and Research .-

racy of the work is unlikely to be questioned, so now we have a solid basis of fact, which is immeasurably more valuable than theories based on inaccurate data, or loose opinions unsupported by test.

The Position of the Motor Cycle.

I now wish to discuss how the present-day motor cycle stands in relation to our latest knowledge of air cooling, how far it falls short of the ideal, and how it may be improved in the future.

Let us first consider by what means the heat generated inside the cylinder is dissipated. The object of generating heat is, of course, to provide power, and some of the heat generated is used directly in the form of work. Of the remainder, part is contained in

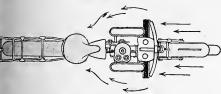

Fig. I .- Leg shields screening the cylinder

the exhaust gas, and the rest has to be dissipated either by direct radiation or by conduction to the atmosphere. The proportion of the heat that goes into work, exhaust and cooling can be measured, and on a good engine they are very roughly equal to one another. The heat turned into work is actually rather less than one-third, and the heat in the exhaust rather more than one-third of the whole. The heat turned into work depends on the thermal efficiency of the engine, and the exhaust heat depends somewhat on the valve timing and a good deal on the design of cylinder ports, hence the heat to be dissipated by cooling can be influenced to a marked extent by good design.

Dissipation of Heat.

Now let us consider how the heat can be dissipated from the cylinder. The means of losing heat from the cylinder are three-fold:

(1.) Radiation.

(2.) Conduction to the air.

(3.) Conduction to other parts of the engine.

We will now consider each in turn:

(1.) Radiation means the sending out of heat waves in the same way as the sun sends out heat waves to the earth. This form of heat dissipation is independent of the surrounding medium. It can take place in a vacuum, and depends only on the temperature and the type of surface of the radiating body. Polished metal is markedly inferior as a radiating surface to a dull surface. The heat dissipated by direct radiation is small on an engine working in a rapid draught of air, but it becomes more important as the draught is decreased.

Conduction of heat to the air is the principal means of cooling, and it is to this feature that we must pay most attention. The two important things are that the air speed past the hot surfaces shall be as high as possible, and that the surfaces themselves shall be sufficiently large and as near to the temperature of the

hottest part of the cylinder as possible. The latter fact, though fairly obvious, is sometimes overlooked; it is no good lengthening the cooling fins, so that the tips are practically cold when the barrel of the cylinders is hot.

Speed of Impinging Air.

It is in the matter of air speed past the cylinder that I consider that present-day motor bicycles are bad, particularly twin-cylinder machines. There is no use running away from the fact that air flows in a way that is governed by natural laws, and that it will not flow round sharp and go in and out of blind holes to oblige the sanguine designer. The present-day machine has its cylinder shielded to an unfortunate extent by the front mudguard; no doubt something might be done with air deflectors, but nobody seems to have made much progress in this direction.

There used to be a small motor bicycle known as the Motosacoche, in which the engine was enclosed in a netal box fixed inside the frame. This had an air scoop arranged on each side, and I think it probable that the draught over the cylinder on this machine is actually greater for the same speed of the bicycle than on the more usual open type of machine.

Unless a fan is fitted, it is not possible to obtain a draught over the cylinder as great as will give ideal results for power and petrol consumption. In solo machines it is doubtful whether the extra cost of a fan would be justified, but on sidecar combinations it is quite possible that it would be worth while. The fan should probably be of the centrifugal type, and if an outside flywheel is used, then it can easily be made to serve as the rotor of a fan of this type. The cylinders should be cowled in to some extent to ensure the air flowing where it is most needed. An engine so fitted could be run indefinitely at full throttle, and could be counted on to give a better average horse-power than one which depended on natural draught alone.

The trouble is intensified when leg shields of the pattern shown in fig. 1 are fitted. The type of shield that is curved round the legs is better, and perhaps

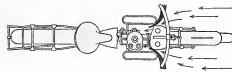

Fig. 2.—Shields designed to act also as air deflectors.

something might be done in the direction of making leg shields into air deflectors instead of air obstructors. A suggestion is given in fig. 2. It is probable that a certain amount of mud would be splashed on to the cylinder, and it is not easy to see a way of avoiding this altogether.

The Cooling of Twins,

The twin-cylinder machines are much worse than the singles in respect of cooling, the reason being that the rear cylinder has a very poor chance to keep cool, particularly if the angle between the cylinders is small. Matters are made worse still when the exhaust port is at the rear, as it is in most twins, and it is scarcely fair to expect the exhaust valve spring to retain its temper and the exhaust valve its seating under the

Air Cooling and Research .-

adverse conditions. One of the best arrangements I have seen used is that in which there is a big angle between the cylinders and the front cylinder is nearly horizontal,

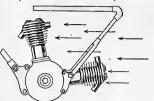

Fig. 3.—A twin engine, the front cylinder of which is nearly horizontal, thus allowing the rear one to be effectively cooled.

so that the back cylinder is almost unshielded (see fig. 3).

The ideal arrangement of a twin would seem to be across the frame, as in fig. 4, but it is rather difficult to make this a practical scheme, as it must be more

or less in the way of the rider's legs. Another arrangement possible is to have a flat twin set across the frame, but it is not easy to arrange for a good draught and at the same time to exclude mud.

The best remedy seems to me to be the use of a fan. This can blow between the cylinders, so that the air flows over the cylinder barrels and heads. Here again it is not very suitable for the conventional side valve cylinders, but works out well for overhead valve designs.

Oil-cooling.

Conduction from the cylinder to the base of the engine plays a very marked part in the cooling system. This conduction is carried out to a very large extent through the oil in the base. The piston in particular loses a great deal of its heat in this way. Still more could be done if the oil were circulated from the

Fig. 4.-A twin with cylinders set across the frame.

engine to the oil tank and back again, as by this means the oil tank would become a radiator. I do not know whether this has ever been tried on a motor bicycle, but it is commonly done on many aeroplanes. [This method has been used for years on the 3 h.p. Enfield.—ED.]

Experience with air-cooled aeroplane motors has convinced me of the superiority of the overhead valve type of engine over the side valve type. The advantages for cooling, power, consumption, and lack of distortion seem to me to be overwhelming, and a study of Dr. Gibson's paper should convince all those who believe in scientific tests. Perhaps a word of warning is necessary; it is not pretended that every overhead valve motor is better than any side valve motor. As in all engineering work, experience is needed in a number of details embodied in the design, and the inherent advantages of the overhead valve type may easily be wiped out by inexperienced design.

Overhead Valves.

Diagrams 5 and 6 give examples of a good and a bad design of overhead valve cylinder. It will be

noticed that the good cylinder has ports arranged for the easy flow of gases, ample fins on the surface of the head where they are most needed, and that these fins are arranged so that the air can flow both through and around them.

The bad cylinder has ports which offer considerable resistance to the flow of the gases; it has insufficient cooling fins, and these fins are arranged

so that the air has little chance to scour the surface of them.

My readers will no doubt be thinking that too much fuss is being made of the insistence of improved cooling, and that presentday machines work well with what I

Fig. 5.—An overhead valve design, in which the head, finning, porting, valve, and guide cooling are excellently arranged.

have characterised as unsatisfactory design. They will tell me that overheating gives them little or no trouble, and that with careful driving their machines stand up very well. What advantages on the road would they get if designs did show a technical improvement? I answer that both the cost and comfort of motor cycling will improve with better cooling.

First as to cost; this will be reduced by economy in petrol and oil, and also by the reduction of upkeep charges. Within the limits likely to occur on a motor cycle engine, the cooler the cylinder, the less is the consumption of petrol and oil for the work done.

Improving Consumption.

Also, the fuel consumption is further improved by the better shaped combustion chamber possible with an overhead valve as against a side valve motor. I think that improvement in mileage per gallon of 10 to 20% will easily be made without sacrifice of speed,

comfort, or reliability. the less frequent need for replacement of valves, valve springs and piston rings, and by the less frequent need for decarbonising, also by the longer life of sparking plues.

ing plugs.

Comfort will be increased by the increased margin of ropower, especially on

Fig. 6.—By way of contrast with fig. 5, this design is poor in every respect.

long runs, and by the fact that no anxiety need be felt that the engine is being over-driven; finally, i will be possible to use efficient silencers without the risk of burning out exhaust valves.

I have not mentioned two-stroke motors, but her again I believe that great improvements can be made I see no great difficulty in designing a 500 c.c. capa city single-cylinder two-stroke that will develop enough horse-power to satisfy the most exacting rider of solo machine. Whether or not this type of moto will eventually replace the four-stroke is a moo question, but the principles of cooling apply equally to either type.

Fred M. Green.

OF INTEREST TO THE SIDECARIST.

NEW IDEAS CONCERNING SIDECAR DESIGN AND EQUIPMENT.

The Cordall Windscreen.

AN elaborate windscreen and hood has lately been brought out by Mr. T. Cordall, of Hornby Street, Heywood, Lancs. When fully erected it is entirely rain, dust, and draughtproof. Three-ply wood is used chiefly in its construction, the windows being of transparent celluloid.

The structure under consideration comprises, besides the front, which opens half down, two sides, a top, and two wings. These wings may be placed outwards, and are fixed by a small strap and snap button, or may be turned inwards, resting button, or may be turned inwards, resting against the sides, and can be fixed by the same strap. The top is hinged. The whole structure can be lifted off altogether, as it is attached by three screw studs and wing nuts.

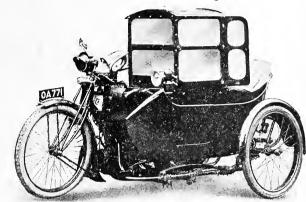

The hood is shaped to the rear portion of the "screen," and can be very easily attached or detached, and when detached can be wraped by it according to the content of the strain of the st

can be wrapped up in a very small space. Mr. Cordall has a wooden box for storing it measuring about 14in. deep, which can be placed either under the cushion of the seat, or may be fixed on the carrier.

Housing the Spare Wheel.

THE problem of carrying the spare wheel on a sidecar outfit in such a

manner as to be out of sight, away

Where the passenger scores over the driver! A windscreen designed by a passenger who has experienced the draughts caused by the average sidecar screen.

Bax Sidecars.

BAX sidecars, made by W. F. Baxter, 14, Wells Road, Bristol, are very popular attachments. Particular care has been paid to the construction of the sidecar body, which is built on the aeroplane principle, the frame being

constructed chiefly of silver spruce, strutted and braced together. The whole of the standard body is covered with polished steel, the body of the Modèle de Luxe being aluminium. A mahogany polished casing is fitted round the top of the sidecar, giving it strength and durability.

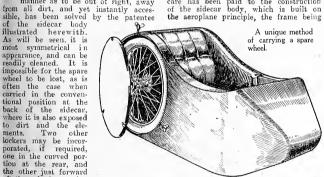

The seat and the back of the sidecar are movable, and under the seat is a tool box, while there is ample room at the back for a two-gallon tin of petrol. No door is fitted.

The Gerald Sidecar.

THE Gerald sidecar has its body built of well-seasoned ash and three-ply wood. There is a locker behind the back and also under the seat, while the body is well upholstered and hung on four coil springs. It is provided with four

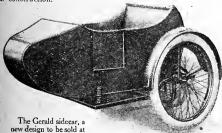

point suspension.

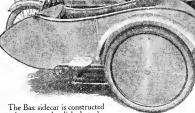

It is sold to the public at a very moderate price, less tyre and tube, by the Gerald Sidecar Co., 1a, Seymour Villas, Anerley, London, S.E.20.

a moderate price.

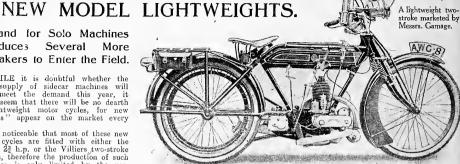

of spruce and polished steel

Demand for Solo Machines Several induces Makers to Enter the Field.

WHILE it is doubtful whether the supply of sidecar machines will meet the demand this year, it would seem that there will be no dearth of lightweight motor cycles, for new "makes" appear on the market every week

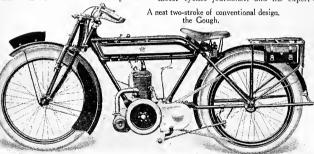

It is noticeable that most of these new motor cycles are fitted with either the J.A.P. 23 h.p. or the Villiers two-stroke engines, therefore the production of such machines is only limited by the productive abilities of the firms concerned, and also of those firms who supply gear boxes and frames.

At the present time there seems to be an unlimited supply of all these units, whether production will be greater than demand this year or next is a moot point. In the meantime very few

The Gough.

Another lightweight fitted with the Villiers engine as standard is the Gough, which also has a Burman gear box. Brampton forks are fitted in this case. Mr. Gough was, until quite recently, a motor cyclist journalist, and his experi-

"assembling firms" are producing side-car machines, which is probably due to the fact that frames are not readily obtainable, and also the larger types of engines are not so plentiful.

The three names added this week to the list of lightweight manufacturers, the list of lightweight manufacturers, whose machines we have dealt with in the columns of *The Motor Cycle*, include A. W. Gamage, Ltd., Holborn, London, E.C., Arthur Gough, 173, Broad Street, Birmingham, and D. Read and Co., Orchard Street, Weston-super-Mare.

The Gamage.

As was to be expected, the Gamage As was to be expected, the cannage machine is a good sound proposition on accepted lines, embod ing a Villiers engine, Burman two-speed gear, Amac carburetter, C.A.V. magneto, Druid forks, and aluminium footboards.

We recently tried the machine under the conditions such motor cycles are generally used in London, and found it generally used in London, and found it extremely tractable in trailic, while on the open road the speed and hill-climbing ability compared favourably with the better known machines of this type. The riding position was comfortable. The price equipped with lamps is £70, which might be considered a reasonable figure.

ence in this direction should equip him with the knowledge requisite to know the advantages of using certain units.

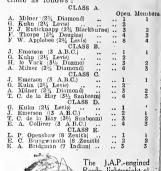

Special features in design and construction are not conspicuous, but the equipment of the machine is good in every respect, and the prices comparatively low. Sixty-six guineas is charged for the two-speed model, or seventy-four guineas with clutch and kick-starter, a single gear rachine, being marketed at 6 fit wine machine being marketed at fifty-nine guineas. The Gough is not being sold by its maker exclusively, but is also obtainable through agents.

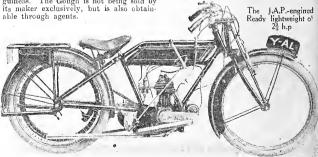

The Ready.

D. Read and Co.'s Weston-super-Mare production is a J.A.P.-engined lightweight fitted with Brampton forks, Albion gear ntted with Brampton forks, Aldoon gear box, Hutchinson tyres, Amac carburetter, E.I.C. magneto, semi-T.T. bars, etc. Rubber faced footboards are fitted as standard equipment, and altogether the Ready is a neat little machine, which should create a reputation among West of England riders of light four-stroke solo machines.

The Recent Essex Hill-climb. The Official Formula Results.

The committee of the Essex M.C. announce the results of the recent hill-climb as follows:

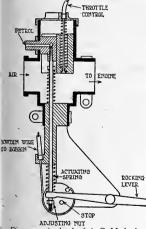

MOTOR (YCLE

A MECHANICAL CARBURETTER.

N many carburctters quite a considerable quantity of fuel is wasted owing to blow-back. This may be caused y a rush of exhaust gas through the alet valve when it first opens, or by the ebound of the gas in the induction pipe

then the valve closes.

To prevent waste of valuable fuel, a arburetter has been designed by Mr. A. Mackay, of Avon House, Glover's toad, Small Heath, Birmingham, which these moments supplies only air to the engine, and this is brought about as illows: A jet supplied direct from the etrol tank is fitted with its orifice pointig downwards above the mixing chamber. This jet is is in diameter, and into this a taper needle of slightly less size erminating in a shoulder, which is capble of closing the jet entirely. The eedle is held on its seat by a light pring, the upper of those shown in the actch, until after the inlet valve has egun to open. Then the rocking lever, hich has its right-hand end under the houlder of the inlet tappet, begins to love, and allows the lower spring, which twice the strength of the upper, to pull ne needle off its seat and release a small uantity of petrol. A certain amount of learance is allowed above the adjusting ut, so that the fuel may be admitted aly when the inlet valve is open and a ream of air passing into the engine.

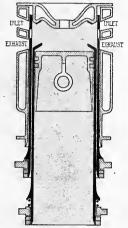

Diagrammatic sketch of A. G. Mackay's mechanical carburetter, showing how the petrol supply is formed by a needle operated by the inlet valve tappet.

oreover, the movement of the lever is nited, and the admission of fuel con-olled by a stop on a bobbin, which can a turned by a Bowden wire. Thus the chness of the mixture can be adjusted the rider.

We understand that this carburetter us been very satisfactory in use, 80 p.g. having been obtained on a 4 h.p. radbury with sidecar and passenger.

THE ALLISON SLEEVE VALVE ENGINE.

MANY people—in fact, most motor cyclists—are satisfied with the poppet valve engine; still, this type sometimes gives trouble from exhaust valve breakage and overheating. On the other hand, the sleeve valve engine does not always hold compression well, owing

Section of the Allison sleeve valve engine.

to distortion of the sleeves, which have to be a very accurate fit. The engine here illustrated is an attempt to combine the good features of both types, and the inventor, Mr. W. M. Allison, of 9, Jubilee Villas. Weston Green, Thames Ditton, describes it as follows:

Sleeve and Poppet Combined.

"I will try briefly to outline the prin-ple here: In the combustion head ciple here: extending all round are cut ports in two rows—inlet on top, exhaust beneath. Two sleeves are fitted. The outer sleeve functions as a distributer to the inlet and exhaust ports, and has nothing to do with holding the compression or explosion pressures. These actions are the sole work of the inner

sleeve. "The inner sleeve has no ports cut in it at all; the top of this sleeve is turned inwards at an angle. On the junk head a seating is turned, on which the inner sleeve works. The inner sleeve is really a large hollow poppet valve. Both sleeves are operated from a camshaft through rockers en-gaging with trunnions on the lower end of sleeve. The inner sleeve's trunnions, or trunnion ring, have a slight amount of movement, which is controlled by a spring around the sleeve itself. The cam gear gives a positive movement both ways to the sleeves.

Effective Cooling of Scatings.

"When the inner sleeve is lifted against its scating by its rocker and held there by compression of its spring, the up stroke of the piston compressing the charge of gas helps to keep it on its seat. As the sleeve seating can be fairly wide and more easily cooled by external means than the average poppet valve seating, and as all the cool inlet gas passes over the valve seats, no overheating or pitting should occur. The travel of the sleeves is quite small, the inner sleeve remaining open from the beginning of the exhaust stroke to the end of the inlet stroke, the outer sleeve moving from its lowest to its highest point in about the same period.

"This engine is designed for watercooling, but tests would show the practicability or otherwise of air-cooling.

"The idea, including various alternatives, is already provisionally patented.'

A DOT SPRING FRAME.

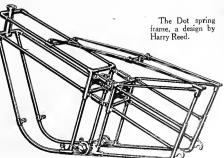

S OME time ago we illustrated a duplex frame designed by Mr. Harry Reed, of the Dot Co., Manchester, and now a similar frame has been patented

embodying a springing device.

It will be seen from the illustration that the rear wheel frame is intended to pivot the rear wheel frame is intended to pivolabout the centres of the gear box sprocket in order that the distance between the driving and driven sprockets may be constant. To render this possible two hinges are used instead of a long bearing which is more usual. These contain ball races. Four spring loaded links connect the two members of the frame, between which there is also a large coil spring in compression, while it is intended to support the rider on two long laminated springs pivoted well forward on the main frame, and at their other ends sliding in blocks at the extreme rear ends of the wheel frame.

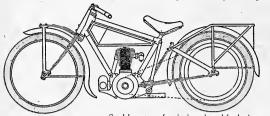

This scheme, which is the outcome of considerable thought, illustrates the main features at which the designer aims, but is obviously not the final frame arrange-ment, since it incorporates twelve pivot

and six sliding joints.

A Stayless Spring Frame.

Frame Members Replaced by a System of Laminated Springs.

Sands's system of springing adapted for both motor cycle and sidecar suspension.

A MONG the large number of spring frame designs that are submitted to us, there are many that are similar; in fact, the great fault of the pseudo-inventor is that he thinks out a device, without troubling to find out whether his idea has been anticipated. One may safely say that there are very few ideas in springing that have not been anticipated, but, provided later patents are improvements upon earlier designs, there is justification for investigation and experiment.

The idea illustrated, however, appears to be new so far as motor cycles are concerned, and is quite interesting, although probably for a solo mount, a machine fitted with such a device would not be quite laterally rigid. For sidecars the design offers possibilities, and the inventor apparently agrees with this view, since he also applies his invention to the sidecar wheel.

As will be seen from the illustrations, bearings as pivotal points are eliminated, the wheels being carried on springs which are also used as wheel stays.

The front springing consists of two leaf springs acting as fork members, with an additional quarter-elliptic spring between them and extending forward where it connects with a loop over the wheel.

Quarter-elliptic springs, three in nur ber, are also used in the rear spring ing, two acting as stays, and a thir connected to a loop over the wheel in manner similar to that adopted at the front. The same system of springin could be utilised for the sidecar whee but in the illustration a simpler metho is shown, which consists of two spring only.

only.
The inventor is Mr. W. J. Sands, c
91, Rathgar Cottages, Belfast.

An Unorthodox Design.

The "Car on Two Wheels"-an Ambitious but Practical Layout.

FROM time to time we receive suggestions and drawings of proposed only quite recently we had the opportunity of examining the complete drawings of a very well thought out little car on two wheels. We illustrate herewith the outlines of the complete machine, but the designer, Mr. W. T. Young, of Ashby Square, Loughborough, is anxions to get into touch with an interested firm, with a view to manu-

facture, before disclosing full details. Briefly, the specification consists of a V twin engine forming part of a unit, with clutch and three-speed gear, the final drive being by shaft and underslung worm. The whole is carried in a simple pressed steel frame sprung fore and aft.

Steering is by wheel, with a geared reduction, and controls are rather on car lines. Two small wheels can be lowered for starting and stopping purnoses, though normally the vehicle travels

on two wheels only. All the detainave been very carefully designed, nonly from the point of view of the rider's comfort, but also from the manufacturing side.

The Holdtite Repair Patch.

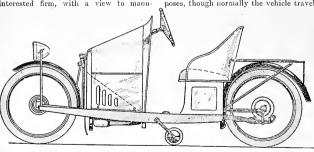

A FEATURE of interest in the man facture of the Holdite repe patches which may not have bee observed by many users of Mr. I Surridge's popular repair outfits the insertion of the fabric' linin between the upper and lower rubbi

Elevation and plan of a single-track monocar, possessing several ingenious features.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

THE SPEED OF A HARE.

Sir,—"O.G.'s" sarcasm regarding the possible speed attainable on a Baby Triumph is quite unwarranted. From my own experience, and that of many other riders of this machine, I see no reason to ridicule the statement made by "Tortoise."

At present I am riding a 1915 Baby Triumph, which will attain a speed of 40 m.p.h. on the level, and on April will attain a speed of 40 m.p.n. on the level, and on April 28th covered the distance from Castle Bromwich to Coventry (14) miles) in thirty minutes—this in blinding rain, and at the tail end of a ninety-mile journey.

I am using a \$\frac{1}{2}\text{in}\$ belt which slightly raises the gear, but with this it will climb Stoneleigh Hill on top gear.

Coventry.

ANOTHER TORTOISE.

STARTING TIPS.

Sir,—I was much interested to read in April 8th issue of *The Motor Cycle*, "Wharfedale's" "Starting Tips for Scott Riders," and should be much obliged if one of your numerous readers would give me similar hints for my

B.S.A. (and sidecar). My difficulty is that a "smart depression" of the kickstarter is not sufficient; it requires a 40 h.p. depression to start the engine when warm—not always—but generally. This is all very well for young riders, but not suitable for elderly ones like myself who find it unduly fatiguing.

Tenterden. J.M.M.

Sir,-May I be allowed to add one tip that I feel sure is worth attention, and which has, in several cases lately, helped Scott riders who have remarked on the difficulty of starting their machines.

Be absolutely sure that the pilot jet is clear and free from any obstruction. It is futile to attempt to start on the main jets if the pilot is choked. This of course applies the man jets it the proof is chosed. This of course applies to the Binks carburetter, which one should take the trouble to understand thoroughly. Get the booklet on this carburetter and read it.

W. WELFORD.

THE IMPORTANCE OF EFFICIENT SCAVENGING.

Sir,—I think the accompanying indicator diagram, taken from a single-cylinder horizontal Crossley engine (hore 9.5in,, stroke 18in.), working on coal gas, may interest some of your readers who pay attention to the question of efficient scavenging.

The diagram with the smallest area was taken after the

An indicator diagram. (See letter from "X.")

governor rod had been held in such a position that six successive explosions took place before the

explosion giving the diagram shown. The diagram with the largest area was taken after the

governor rod had been beld so that only air was admitted for those cycles before the explosion where diagram is shown took place.

The mean height of the larger = .32in. approximately; the mean height of the smaller = .28in. approximately. The difference is .04in., i.e., there was 12.5% loss in mean pressure.

An exactly similar diagram was obtained under running conditions, and the second was taken to prove the reason

supposed. Oundle.

FLYWHEEL MAGNETO.

Sir,-I have been much interested in the description of a flywheel-magneto in your paper. Would it not be possible to fit one of these magnetoes to a flat-twin? If so, this would simplify the housing of the engine, and would permit a much larger engine to be fitted, without increasing in any way the size of the frame. The engine would be any way the size of the frame. The engine would be higher in the frame, and the back cylinder would be above the gear box, the frame being duplex. A lower saddle position and possibly more ground clearance could be obtained. The centre of gravity would, of course, be higher. Would this affect the balance of the machine?

I would like to hear your readers' opinions on this subject. F. ROGERS.

THE 23rd DIVISION ASSOCIATION.

Sir,-I should be grateful if you would allow me through your collumns to call attention to the recently formed "23rd Division Association" which has been started with a view to keeping alive amongst ex-officers of the division, now scattered all over the world, the friendships formed during more than four years of active service in France, Belgium, and Italy.

Full particulars can be obtained from the hon. secretary: Capt. V. E. Cotton, O.B.E., 2, Blackburne Terrace, Hope Street, Liverpool, and I hope that all officers who have not already received a circular on the subject will communicate with him. J. M. BABINGTON.

Lieut, General (late G.O.C. 23rd Division), President 23rd Divisional Association.

AIR VALVE IN INDUCTION PIPE.

Sir,—Your correspondent, Mr. George Maggs, whose letter appeared in your issue of *The Motor Cycle*, April 8th, has not been kind to me; but, as he suggests in his conclusion, "there is more than extra air in the construction of the Rapier economy valve."

I have no doubt introduced a peculiar "pup" to the motor cycling world, and I candidly confess that it is not I who

can be the judge of its merits.

The Rapier economy valve comes into action quite automatically when the throttle is closed, presuming the valve had previously been set to run the engine at a suitable speed

had previously occurring for gear changing.

That alone, I think, answers his question of the valve becoming inoperative.

The uses of this valve leave a big HORACE CASTELL. margin for the individual.

HOW TO BE POPULAR.

Sir,—The letter from "B." (Peebles) under the above heading in a recent issue is distinctly amusing. So many lines of thought are opened up on the tipping question. In this era of the apotheosis of the proletariat, we are never quite sure whether our humble small silver will be appreciated by the possible plutocrat who drives his Ford and hands us our Rolls (not intended!). Anyhow, we surely do not need to buy our popularity.

Speaking seriously, I have never noticed the omission complained of by "B." at any of the English trials: maybe it is the custom in "B.'s" locality, however, for I recollect this little conversation between two visitors to a London

tea shop:

First visitor (to companion studying menu): "Do ye see

anything that strikes ye, Angus? 's Second ditto: "Ay, mon! No gratuities!"

YORKSHIREMAN.

160

PISTON PACKING.

Sir,-In reply to the comments of " Top Heavy " published on page 134 of your issue of January 29th, I have to confess that I do not entirely grasp his argument. I was quite unaware of the type of packing used in Diesel engines, though I quite see the effect he mentions after a 2,000 miles run. But I cannot follow his argument where he says of rings A, B, and C in his sketch, that A is a dead fit to piston, C a dead fit to cylinder (neither expanding nor contracting), and then that B is an expanding ring, pressing C against the cylinder body.

Perhaps "Top Heavy" will explain more clearly.

As to my device, I can only state again that it is a simple

three ring packing, and, when properly fitted, undoubtedly gives a tip-top compression, thus enabling an engine to run on a thin mixture, and preventing the deposit of excess carbon, simply because none is left after combustion. Also, caroon, simply occause none is left after communition. Also, the packing scavenges the cylinder walls well, so that with flat cylinders and plenty of oil there is absolutely no gumining in combustion chamber. Finally, the whole packing is resilient, and continually accommodates itself to the bore of the cylinder, and is even better in effect with old or worn cylinders and pistons, to which it can be easily fitted after a slight widening of one of the existing grooves of the old F. SHUTLER.

TYRE MILEAGE.

Sir,—The following tyre mileage may be of interest. 4 h.p. Douglas sidecar, 26 × 23in. Clincher de luxe all round. At 2,070 miles, pattern nearly worn off rear cover, so replaced with a 26 × 24in. extra heavy Dunlop (looks good for another 1,000 before being retreaded). At 3,360 miles, the sidecar cover, and front wheel cover were exchanged. At 4,178 miles, the front wheel cover gave at the bead, and was replaced with the original back cover with Almagam

was replaced with the original back cover with Almagam retread. The present speedometer reading is 5,266 miles. A Dunlop flat top belt carried as a spare since 2,000 miles, has been replaced by John Bull belt (still in good condition).

Sir,-1 enclose herewith a record of tyre mileage. The figures are, I hope, self-explanatory, but there are one or two comments I should like to make. For any useful comparison it is clearly necessary that the mileage on the various wheels should be reduced to some common denominator. Whether the factors I have used are even approximately correct is very uncertain. The evidence of riders who have used similar tyres on all three wheels would be valuable in this connection.

In case the mileage obtained seems unreasonably low for a machine decidedly easy on tyres for its weight and power, it must be remembered that the bulk of my riding is in Devon, and much of it off the main roads.

For what they are worth, the figures seem to suggest that there is not quite as great economy in using heavy tyres as is generally supposed—at any rate under conditions where cuts of tread or bead may easily ruin an expensive tyre after quite short mileage. Subsequent experience on a 1919 A.J.S. with 700×80 mm. tyres all over rather indicates that for economy size is of more importance than weight. I certainly think that financially à light 700×80 mm. would generally prove a better investment than a heavy 650×65 mm., though I think it would be a little more liable to puncture.

Where freedom from punctures is the first consideration, it is undoubtedly wise to fit the largest and heaviest tyre available on all wheels. E. S. POWELL.

WHEEL STEERING AND PROTECTION FOR THE RIDER.

Sir.—Re my article on mudguarding, published on February 5th, may I suggest, further, the possibility of arranging for more protection for the upper part of the body and for the hands? With wheel steering it becomes possible to continue upwards the top portion of the leg

shield and partially to enclose the steering wheel, as shown in the sketch herewith. No doubt this is somewhat Utopian, but still it may contain the germs of a useful idea.

On some machines the sort of body illustrated could be more easily adapted than on others. The saddle or seat position would have to be as low as possible. The Scott machine is one which naturally comes to mind as being very suitable for such form of protection, because of its open frame. Suitably streamlined, this arrangement should absorb little more power under ordinary running conditions, and certainly nothing worth speaking of in the case of, say, 8 h.p. passenger outfits.

Baildon.

ADIES AND COMPETITIONS.

Sir.—For the past year it has been my ambition to ride in the London-Eduburgh run at Whitsun. I received my first shock at the Motor Cycle Show when the new machine I had ordered did a £20 jump. I never realised how much I had wanted it until I thought I had lost it. It was my ideal motor bicycle and none of the others would do as a substitute. After twenty-four hours of auxious thought I decided not to cancel the order. As the machine had electric light (and what an asset that would be in the London-Edinburgh!)

Then came the day when I took delivery, and found that it more than fulfilled all my expectations. Comparing it with others (that have been rising in price steadily since the Show),

Only members of the Motor Cycle Club can ride in it, and adies are not eligible. I wrote to ask why, and the secretary asswered that the subject had been discussed recently and urned down, but that an alteration of the rule might be anade another year.

I know nothing about motor cycle clubs, but, I presume, he housing problem is responsible for this. I suppose the I.C.C. has premises in London, and the inclusion of ladies mong the members would mean extra rooms at the club. robably, at present, the number of ladies who would join rould not justify this outlay. I wonder, though, if, for a educed subscription, they could not become merely riding nembers.

It does seem hard that a boy of fourteen and a half years ay ride in the Jarrott cup trial, while we, just on account to make a reruled out of everything. It is very disappointing. Are there others who share my feelings on this subject? I enclose a photograph of the aloresaid "ideal machine." (Mrs.) E. MANVELL.

PEED WOBBLE.

Sir.-A point we have not seen mentioned, decided us a theory which may help to clear up this per-

lexing problem.

Is it not possible, on chain and belt driven machines, here the drive to the rear wheel is necessarily out of eutre, that when certain conditions are-met with, say a ump on the road, a temporary check would cause an normous pull on the drive, thereby causing the rear part f the frame to spring in the direction of the final drive osition and throwing the rear wheel out of alignment? This will occur at all speeds; at slow or moderate speeds are rider automatically corrects the machine without knowing lathing has commed.

nything has occurred.

At speed, however, the only warning is a sudden dive to ne side of the road, which demands a drastic turn in the pposite direction, the resulting centrifugal force set up, gain destroying the balance, and so on, until the wobble checked either by quick shutting down in the first place r crashing.

LLOYD AND PERRY.

Sir,-I have been very much interested in the recent iscussions in your paper on the subject of "Speed

I am very much surprised at the number of riders who, judge by their letters, habitually attain speeds of from 0 m.p.h. to 70 m.p.h. on the road. Perhaps one of these

speed-merchants will be kind enough to tell me how it is done, as strangely enough, although I have been riding for many years, and have ridden some of the best known sporting mounts, yet I have never, on the road, exceeded 55 m.p.h. Either the machine was all out, or the road surface threatened to put a very sudden end to higher speed. I should also like to know what instrument was used in recording these high speeds which your correspondents so frequently attain, as my experience is that the majority of speedometers are inaccurate and usually favour the machine, sometimes by as much as 10 m.p.h. At the present moment I am riding a very well-known sporting grid with variable gear, and consider I am doing well if Lean knock off a few miles in the present of 50 m.h. I can knock off a few miles in the region of 50 m.p.h. One

of your correspondents, riding the same make of machine, states that at 65 m.p.h. he gets no "speed wobble!"

If you will be so kind as to publish this letter, perhaps some of the aforesaid speed merchants will volunteer the information how they attain these speeds, and how they survive their attainment over the post-war road!

Rugeley.

Sir,—I have followed with great interest the topic of "Speed Wobble." I venture to suggest that wobble may be brought about by a full tank of fuel—design of tank, of course, being considered. The approximate weight of the fuel would be 15-20 lb., and since wobble has started, from whatever cause, this weight would be buffeted from side to side against the walls of the tank with considerable force, but with what result I shall leave for more experienced riders to answer. H. H. HARRISON.

GOOD SERVICE.

Sir,-I ride a Sun V.T.S. two-stroke, and recently wrote to the makers stating that it required overhauling, and requesting to be furnished with an estimate of the costs. By return I received a reply asking me to send on the engine complete, and it would be overhauled and replacements made free of charge. This was indeed a pleasant surprise.

I sent on the engine as requested, and in a few days

received another communication saying that a new crankshalt and connecting rod had been fitted, and that the engine had heen forwarded. On calling at the station for it I found that full carriage had also been paid on it by the firm. I think this prompt service and generous treatment deserves commendation. Usual disclaimer. SATISFIED.

Monivea, Co. Galway.

Sir,-It is refreshing to read in the columns of the Motor Cycle occasionally of firms who give prompt and courteous service, where repairs are required. Especially is this so when one has been treated to delay and scart response to enquiries. As one of your numerous Scotch readers, may I ask you to insert, for the benefit of other Scotch promptness by the Scottish Acetylene Welding Company, of 1,103. Argyle Street, Glasgow.

The repairs necessitated acetylene welding and machining, and were a beautiful job. The general inference hereabouts is that this can only be carried out by some of the firms in England who specialise in this work. While good service is given by some of these firms, the freightage is

enormous, and saving is effected by getting it done here.

A New Sidecar with Many Refinements.

Detachable Hub Axle. Simple and Rigid Frame Fittings.

A RECENT addition to the ranks of high-grade sidecars is the Whitley Model No. 20 made by the Whitley Manufacturing Co., of Charterhouse Mills, Coventry. The designers are Messrs. B. L. Price and W. Covington, who have for many years been intimately associated with the production of sidecars.

The attachments are worthy of special mention. As will be seen from the illustrations, the front fitting (of registered design) is so constructed that any tendency to "roll" or twist in the frame tube is eliminated by the special lug which embraces the engine tube, and also bears against the middle rail of the motor cycle. By merely removing one large-shouldered nut, which pulls up

The front attachment, showing the special lug bearing on the middle rail, and the manner in which the fitting may be detached.

point stay, although it has not, perhaps, all the advantages of an entirely separate member. The back attachment follows conventional practice, and is of sturdy construction.

A Chassis with no Loose Clips.

Incorporated in the chassis there is an interesting combination lug. Into this lug are brazed the two main longitudinal tubes; the curved under-tube which extends across the chassis, and the mudgnard stay tube. The rear C springs are also anchored to this lug, which, in addition, provides a housing for the wheel spindle. The latter is easily detachable by the removal of one nut. A large luggage carrier, which has a considerable capacity, is brazed in position at the rear of the chassis.

A Roomy Body.

A graceful body with plenty of leg room and two lockers is provided. From an inspection of the bodies in process of construction, we are able to say that

e are able to say that every care is exercised in the selection of

materials. The general finish, upholstery, and paintwork are all excellent, as are the door fittings, apron buttons, etc. The suspension is etc. The suspension is by means of double laminated C springs of ample dimensions; these, we found, ab-sorb road shocks in a most effective manner. The too usual heterogeneous collection of loose clips is absent; brazed in place, or embodied in the while patented lugs, each chassis is built up on jigs to an absolutely standard pattern thus ensuring uniformity.

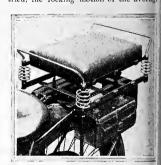

In the construction of the body itself, nothing is used but well-seasoned wood, while for the chassis special high-carbon tubing is employed throughout, and the attachments, with the exception of the actual clips, which are maleable castings, are turned and milled from the solid.

The whole sidecar weighs considerably less than many of equal capacity, and altogether the manufacturers have succeeded in producing an exceptionally attractive article.

A WELL-MADE PILLION SEAT.

DESPITE the comparatively large number of pillion seats on the market, the popularity of this method of carrying an extra passenger is such as to justify the introduction of new seats if they embody improvements. The pillion rider no longer is content with a cushion or pad tied to the carrier, and the condition of present-day roads also causes the passenger to think of means whereby discomfort is alleviated.

The seat under review was devised primarily to enhance the comfort of it designer. Being minus his right arm, he has been relegated to the passenger's tate. Suffering under his physical handicap, he naturally discovered the draw backs of several pillion selets he has tried, the rocking motion of the average.

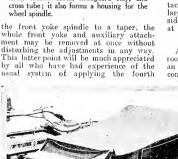

The Shakspear and Truslove pillion seat shown on the carrier of a lightweight.

air or spring cushion being the chief diadvantage. To eliminate this, the sea illustrated is made to slide vertically, o guide rods at the four corners, where is supported by coil'springs. These ar arranged so that they are always in conpression in order to prevent "chatter ing" when the seat is unoccupied.

A main frame of steel readily attad able to any carrier, and four npriglguide rods, which are continued to fonhandles at each end of the seat; form thrigid portion of the device. The seat substantially built on a wooden bas and is well upholstered.

The makers are Shakspear and Truslov 9, Goring Road, Stoke, Coventry, and the price is 35s.

The combination lug, which takes the

main chassis tubes, mudguard stay, and

The graceful outline and roomy body of the Whitley Model 20 sidecar are commendable features.

HOW TO BECOME SUPER MOTOR CYCLIST

A Competition WINNER, A Petrol SAVER, A COMFORT Rider, I suggest you use a BINKS Carburettor, and not HANDICAP yourself by using any other. Here are 3 SUPER Motor Cyclists, they all use (after severe comparison tests) BINKS Carburettors. Please read what they say, and - PROFIT BY IT.

APRIL 22ND, 1920.

Mr. ROBBINS, winner of the much-coveted Manufacturer's Trophy-A Reliability Run from London to Edinburgh and back. "Motor Cycling" described Mr. Robbins' performance as "truly marvellous." Mr Robbins says, "in preparing for this test I naturally had to find out the best Carburettor and the one most likely to bring me success. After exhaustive tests I proved the BINKS to be the best. Its wonderful flexibility, and controllability, easy starting and petrol saving advantages cannot be ignored."

Mr. O'DONOVAN, the Speed Wizard, whose sensational recordbreaking feats at Brooklands on his Norton startled the whole trade, knows probably more about getting speed out of a machine than any other man in the world, says, "Record Breaking is a very costly business and you must have the best of everything. The BINKS Carburettor I have definitely proved to be faster than any other, hence my using it."

Capt. Brittain, who knows how to get more miles to the gallon than any other competition rider, says, "I think there can be little doubt that the BINKS Carburettor is the best, its flexibility and economy in petrol are so pronounced that to use any other creates a handicap against you. In the recent Reliance Cup Trials, Capt. Brittain on his Sunbeam did nearly 124 miles to the gallon, 5 other Sunbeams competing with him averaged under 100 miles to the gallon Capt. Brittain was also the best in any of the classes.'

NEARLY 25% SAVING IN PETROL. THINK WHAT THIS MEANS TO YOU. You can save this on your fuel bill, why waste 5/- in every £1? Get a Binks and stop it. I have over 10,000 testimonials. Read this recent one.

t, Winicombe St., Glasgow, W March 13th, 1919.

Dear Mr. Binks,

1 feel 1 must write and express my deepest gratitude to you for placing in the market a Carburettor which brings Motoring within the reach of those, like myself in these days of impossible prices.

The instrument 1 am using on my "Norton" at present is giving entire satisfaction. It is not the first of it kind as 1 have ased them in N.U.T., Dot.Jap (8 h.p.), two previous Nortons, Triumph and a Zenith,

Last summer 1 ran from here — or rather from a village on the other side of 'here' — to the south of South Wales. It was a two days' run, and the consumption surprised me. I used only 2 gallons of pertorl working out at 157.3 m.p.g. and as 1 was astride a rather 'hot-stuff' Norton you may guess that my average speed was well above the legal limit.

In the Palmer Trophy Trial organised by the Western M.C.C. of Glasgow last Saturday, I completed the course with 100 per cent, marks, and used just a shade over 1 gallon — course of 110 miles — and that included some very beavy going, at times against a fairly stiff wind with rain and sheet.

Round shout town my average is a little over the roo m.p.g. mark. In traffic, the combination — Norton plus Binks — is a treat, easy starting, slow running, etc. I need not enlarge, you have heard all about it before.

The Carburetor delivered with the machine gave 4 m.p.g. under the same conditions.

Yours faithfully John W. Walker.

The Binks 3 jet 3 phase jet damping carburettor although more expensive is far in advance of all others, and you can have one on approval for one month's trial. See terms in my list, which will be gladly sent on application.

Belgian Motor Cycle Paper.

We are in receipt of a copy of the first me of La Vie Motocycliste, a paper blished in Liège, Belgium. It is the icial organ of the Belgian Motor Union.

e Oldest Motor Cycle Club.

A document has just come to hand ich was presumably entrusted to the stal authorities some little time ago. is a monthly circular of a now well-own motor cycle club, and contains a t of fixtures for the month of April, 90. Surely this club must be the oldest existence.

A correspondent informs us that the lice are very active on the London-nbridge road, between Rushey Green d Bellingham, also between Bromley d Bromley South, where a 10 m.p.h. eed limit is in force. Accidents, rough carelessness, have been quite ignent lately on this latter stretch, o at least of which have proved fatal. It is also stated that the police a particularly active in Walsall, and at many summonses were issued last ek on motorists who exceeded the eed limit in the main thoroughfares of

ports and Exports.

American motor cycle manufacturers e evidently becoming increasingly tive in the export market. March ures, in the Board of Trade returns, ow a decided jump compared with the evious month.

**HORTS FOR MARCH.
**IMPORTS FOR MARCH.
**stor cycles ... 1913 ... 1919 ... 1920
**mber ... 206 ... 34 ... 409
**lue ... £14,709 ... £7,923 ... £40,057 In February, 286 motor cycles were ported, as against 409. Their value, duding parts, being £25,522, and 0,057 respectively.

EXPORTS.

Exports of motor cycles, it is gratifyto observe, are on the up grade. verseas, the demand for British maines is as insistent as ever, and the es but little to meet the demand.

Nearly double the number of machines ported in February were recorded for port last month, the exact figure being 39, their value being, apart from ares and accessories, £117,474. It is be observed that our exports are st over four times our imports.

Ex	PORTS	FOR	MARCH.	
cles	1913		1919	192

tor cycles 1913 ... 1919 ... 1920 unber ... 1,447 ... 989 ... 1,639 lue, in-plu din g pares and uccessories £75,917 ... £123,318 ... £170,327

A.A. Initiative.

Recognising the difficulty experienced tecognising the dimediate experienced by motorists in finding their way through Launceston, the A.A. has fixed up a number of direction plates at various corners. These make it practically impossible to go wrong, and will undoubtedly be much appreciated.

London Scottish Cadet Battalion.

It is hoped to form a social club (with premises in the Victoria district) for past and present members of the London Scottish Cadet Battalion. Motor cyclists who are interested should write for particulars to the hon. sec., 1st C.B. London Scottish, 109. Victoria Street, S.W.1, who would also be very pleased to receive any suggestions.

A Cairo reader, Monsieur M. Fadel, who speaks enthusiastically of his Douglas and its use in Egypt. It will be observed from the badge on the handle-bar that he retains his membership of the A.C.U

Special FEATURES

AIR-COOLING AND RESEARCH. ERITISH MOTOR CYCLE RECORDS. NEW LIGHTWEIGHTS.

Profiteering.

A reader was recently charged 9s. 6d. for an ordinary kick-starter spring, the actual value of which would be about 1s. 6d. It is certainly time that this sort of profiteering should cease.

Arranging Motor Cycle Tours.

An extraordinary number of applications have been received by the Auto Cycle Union from members for assistance in preparing tours. It is evident from these that the coming season will produce more touring motor cyclists than any previous year, despite the fact that the output of machines is still restricted by trade diffi-culties. The Auto Cycle Union has recently revised its appointments of official hotels and repairers throughout the country, and it is interesting to observe that one outside representative of the Union visited over 700 establishments during the past year.

Government and Petrol Companies.

A statement was made recently by Sir Marcus Samuel at the Commercial Motor Users' Association which is of particular interest to users of motor fuel. He said, during a discussion on the scarcity of during a discussion on the scarcity of petrol and the possibility of substitutes: "The Shell Co, would take part in the distribution of any substitute for petrol which could be found on any terms the Government thought fair. He and before the country of the cou his brother would never sell out to the United States. The Government had had many chances of buying a controlling interest in the Shell Co., and had refused every one."

The Liverpool Motor Club Speed Trials.

Open speed trials will be held by the Liverpool M.C. over a flying and standing kilometre on a private road near Birkenhead on May 15th. There will be thirty-four classes for scooters, motor cycles, motor cycles and sidecars, cycle cars, light cars, and cars respectively. The course is said to be safe for any speed.

In addition to the Reliance Open Speed Challenge Cnp, many other special cups, prizes and awards will be given for results on both time and formula. Cups and medals will be given to amateur and club members. Admission will be by ticket only. Clubs intending to be present should apply for tickets for their members to the hon, secretary, Mr. E. E. Holloway, 36, Sandown Lane,

Wavertree, Liverpool.

It will be noted that the date for this event has been altered from that mentioned in the A.C.U. programme of events.

MOTOR (YCILE

London to Manchester.

Several G.N.'s, an A.V., a Blériot Whippet, a Tamplin, and a Black Prince Buckboard were represented in the Junior Car Club's cross-country trial from London to Manchester last Saturday. Fine weather prevailed, and the day. Fine weather prevailed, and the pace was hot. From Daventry, where lunch was taken, the competitors journeyed via Rugby, Hinckley, and Ashby-de-la-Zouch, to Derby. We drove many miles behind Maj. Empson's A.V., which we also observed in the recently cancelled Paris-Nice Trial. The little runabouts travelled exceedingly well and regularly, and proved themselves as fleet as the accepted forms of light cars. After suffering clutch trouble on two occasions, A. G. Cocks abandoned his sporting attempt to take a 23 h.p. Union-engined Buckboard with two passengers through the trial. This was entering the Peak District. Both prior to and after tea at Bakewell the route was enjoyed, and it is a pity that there were no observed hills in the High Peak, for the competitors passed by the foot of many which would have provided some sort of amusement at least.

R. C. Empson (8 A.V.), L. Baynes (6 A.V.), and R. Windover (8 G.N.) failed to make a clean ascent of the observed hill by Castleton.

Subject to confirmation by the committee, the awards obtained by cycle car owners are as given herewith.

THE PRICE OF PAPER,

Paper to-day costs approxi-mately five times as much as in pre-war days.

Since Jan. 1st last, paper has risen 2d, per lb., which represents an increase of over £35,000 in the annual paper bill of "THE MOTOR CYCLE."

The paper used for each copy of this issue costs over 3d., ex clusive of printing and pro duction charges.

A Successful Club.

In the London-Land's End trial for the Jarrott cup eleven gold medals were gained by members of the Surbiton and District M.C.C.

The Slough Depot.

The sale of the Slough Repair Depôt, and the remaining surplus stocks of war worn lorries, cars and motor cycles is of more than passing interest to motor cyclists. It is not improbable that, in the hands of a live business concern, the Slough Depôt will place in the market a large number of rebuilt motor cycles which may have some effect upon the present position of supply and demand. As to whether the public will directly benefit is a moot point, a change of this nature may at least influence the prices of second-hand machines.

MOTOR CYCLE TAXATION-

NO CHANGE THIS YEAR In his Budget speech tast Monday, Mr

Austen Chambertain, Chancettor of the Exchequer, stated that: The present taxes would remain in force

until the end of this year. From January 1st, 1921, onwards mote vehicle taxation will be based upon the recommendations in the Ministry of Trans port's Report (reviewed on pages 466 an 467), viz., 30 |- for tightweight motor cycle ander 200 lb. 60 |- for solo machines over the contract of the contract 200 lb. £1 extra for sidecar. £1 for three wheelers under 7 cwt.

The Ministry of Transport would be r sponsible for the collection of the taxes.

The new taxes were estimated to yie £9,000,000.

NEW AMERICAN RECORDS.

Nearly 112 m.p.h. Twenty-three New Records. 111.98 m.p.h. Solo and 87.52 m.p.h. with Sidecar. 102.8/ m.p h/ with a standard type

WITH an "oversize" engine, i.e., 1,114 c.c., the Harley-Davidson racing experts established new records last month on Daytona Beach, Florida, which extends for fifteen miles, and is said to be one of the finest stretches of open ground in the world.

For the kilometre and mile distances the new solo records are well over 103 m.p.h. with a 1,000 c.c. engine, while 11.98 m.p.h. is the figure with one of the new type "oversize" engines. The following are the new records

established by Harley-Davidson machines :

The 1920 London-Edinburgh Run.

A New Route including the Famous Kirkstone Pass in the Lake District.

visited, but the old course will be followed to Doneaster, beyond which it will be quitted for Harrogate. From this place the road across country ria Skipton and Kirkby Lonsdale to Kendal represents moderate difficulty, the chief ascent being at Blubberhouses, between Harrogate and Bolton Bridge.

After Kendal the course runs to Amble-After Kendal the course runs to Ambleside, and the new feature of greatest interest is the inclusion of the three miles climb from that townlet to the "Travellers Rest" at the summit of Kirkstone Pass. Here the 1,476 feet level is reached, and the mountain side affords a very real test of a machine. After the first corner is negotiated, quite early in the accent, there is nothing further of a tricky nature to traphly the further of a tricky nature to trouble the rider, although plenty of real climbing power is needed, especially for the last sheer half-mile, following a lull in the severity of the climb. This difficult ascent and the descent of the pass, to

Patterdale, must be taken non-stop.

Later in the journey, after a tea stop
at Lockerbie, there will be another nonstop section, commencing at Moffat. The course ascends for seven miles, but the

B) Moffat to "Source of the Tweed ROUTE OF 1919

gradients are not excessive.

HIS year's London-Edinburgh run will be more than a mere test of endur-ance for the driver. There will be two non-stop sections, in one of which the competitors will be required to climb Kirkstone Pass.

The start will be from the Old Gate The start will be from the Old Gate House Hotel at the top of Highgate Hill, London, at 8.30 p.m. on May 21st. Competitors will start at half-minute intervals in the usual order, viz., motor bicycles first, sidecars and cycle cars second, and cars third.

Gold medals will be awarded to entrants who are not more than 15m. early or 10m. late at any point on the journey, and who

successfully cover the special sections.

Silver medals will be awarded to entrants who are not more than 15m. early or 30m. late at any point on the journey, and bronze medals to entrants who are not more than 15m. early or one hour late.

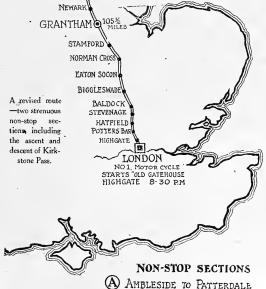

The entrance fee for all vehicles is 30s.,

and entries must be sent to the trials hon, sec., H. G. Bell, 77, Stapleton Road, Stroud Green, N.4, by first post May 4th.

Motor cyclists who are not members of the M.C.C. must send in their application forms to the secretary. Mr. Southcomb May, 34, Gower Place, London, W.C., not later than Tuesday, April 27th.

The New Features in the Run.

In altering the route for the London to Edinburgh run from that followed in recent years the Motor Cycling Club has introduced features which add greatly to the interest of the journey, as well as to some extent increasing the difficulty of the trial. York will not be

TAXATION.

Extracts from and Notes on the Government Committee's Report. The A.A. and M.U. The A.C.U. Explanation. A Criticism of the Committee. Protest.

N the first page of this issue we give our views on the Budget pro-posals, as far as they affect motor cycle taxation, which have been placed before Parliament. These proposals are that motor cycles shall be taxed 30s. for lightweights under 200 lb., 60s. for solo machines over that weight, 20s. extra for sidecars, and 80s. for threewheel runabouts. That such taxation is unfair there can be no denying, and we reiterate that only a fuel tax can correctly apportion the cost of the roads to those who wear them out. The Government objects to a fuel tax, and the proposed method of taxation arrived at by compounding present taxes and the fuel tax on an assumed mileage is the hest solution found by the Committee. It would appear that motor cycle interests have not been given the attention due to them, especially considering that motor cyclists outnumber all other classes of motor vehicle users.

Present-day motorists and motor cyclists are to pay for the repair of roads damaged during the war by motor transport used for the benefit of the community and at a time when private owners were not permitted to use the roads unless on work of

national importance.

It is suggested that fees for motor drivers' licences, penalties to be received for keeping vehicles without proper licences, at present received and retained by local authorities, form part of the incomes to be made available for roads.

No Rebates on Old Motor Cycles.

A 25% rebate is suggested in the case of cars which were constructed prior to 1913. The report distinctly states that this refers to cars only. This means that owners of old motor cycles (usually working men using such machines as a means of transport to their daily work) may be taxed as much as 20% of the value of their mount. Is this helping the working classes to live in the healthier districts adjacent to the industrial centres? This must be altered.

It is suggested that the present registration fees be combined in the new scale of taxes, and that the licence will be a card of a distinctive colour, which will indicate when it expires. This will be required to be always carried on the vehicle in a conspicuous place where it can be seen by any passenger, or, when the vehicle is stationary, by any police or taxation officer.

No Quarterly Licences.

The following is an extract from the Ministry of Transport's Committee report. ". The Committee have The Committee have adopted three categories of motor cycles, with a maximum weight limit of 7 cwt, and have placed the respective duties at the lowest annual rate of duty that appeared feasible in view of the difficulties of making provision for the issue of quarterly licences for motor cycles." is constrained to wonder why there is any greater difficulty with motor cycle CIA

licences than those for cars. This is most unfair to a class of motorist least able to pay heavy taxation in a lnmp sum.

The New Taxation and the Price of Petrol.

The lot of the motor cyclist as regards taxation and the price of petrol does not seem as if it will be a very happy one. seem as if it will be a very happy one. Motor cyclists at once think the proposed taxes exceedingly heavy, being three times the existing tax. It is then pointed out to them that the petrol tax will be abolished, and therefore consumers will be so much better off, as petrol will be 6d. a gallen cheaper.

This appears fairly satisfactory, especially when a rider figures out that if he covers a long distance his riding will not cost him any more than if he were taxed under the old scheme. This is perfectly

From the moment the new taxation was first suggested, "The Motor Cycle" has vigorously opposed any form of taxation which would not be proportionate to the weight and power of the machine and mileage.

We have repeatedly urged that a tax on fuel is the only fair means of apportioning the burden of taxation. The A.C.U. has failed to convince the Government that such a tax is preferable.

We consider the schedule proposed by the A.C.U. and that of the Government Committee as alternatives to be unfair to motor cyclists. They are likely seriously to injure the motor cycle industry, and in consequence ultimately bring about unemployment.

Why should only motorists pay for the upkeep of the national highways which are used by the whole community? Why should motor cyclists pay from £1-10-0 to £4 when the roads are free to heavy horse-vehicle traffic, which does more damage to the surface?

Is it not time that the motor cycle and car be regarded as part of our national requirements instead of luxuries to be taxed out of existence?

Heavy taxation on motors will retard national development. \$0000000000000000000000000000

true, if the present petrol price holds, and if he covers a sufficiently long distance; but, if he rides only three or four thousand miles a year he will be much worse off than he is now, and far worse still if the price of petrol is raised.

It is a curious fact that, as soon as the abolition of the petrol tax was mooted, petrol immediately leapt up in price, and we should be very much surprised, if and when the petrol tax is eliminated, to find that petrol is appreciably cheaper, or if it is cheaper that it will remain so very long.

It is not generally realised that the Government's chief objection to the petrol tax, irrespective of the difficulty of collection, is the difficulty of defining motor spirit. At first thought, the man in the street may consider that motor spirit is petrol or benzole; but these are not the only liquids which can be used as fuel for motor bicycles. There is alcohol, which is likely to be made suitable in the near future, and paraffin, which can be used not only for lamps and oil stoves but for internal combustion engines as well, and it is impossible to guarantee that if it is bought for use in a paraffin lamp it may not eventually find its way into the tank of a motor bicycle, and it is considered unfair to tax the general public who do not motor but use paraffin in their lamps and stoves. This is one of the most important points which the Government has taken into consideration in drawing up the new taxes, and the snggestion made by the organisations that all motor fuel should be taxed and all users of it, with no exceptions, was not accepted by the Government because of the difficulty we have previously mentioned in defining exactly what motor fuel is.

A Temporary Measure.

Sir Thomas Berridge, the R.A.C. representative on the Committee responsible for the motor taxation proposals, signed the report "with some reluctance." He is still of opinion that the method of taxation proportionate to user, by means of a tar on liquid fuel, is by far the fairest and best, and, in his opinion, this method o

Mr. W. Rees Jeffreys, the secretary of the Society of Motor Manufacturers and Traders, also adds a rider to the effect that he has signed the report subject to tions including "As a temporary measure that the rate proposed for private

motor vehicles be reduced from £1 to 15s per unit of horse-power for the first year of the operation of the new scale o taxation.

The amount required by the Treasury from motor vehicle users is £7,000,000 The estimated revenue on the scales sug gested is over £9,000,000, or, after allow ing costs of collection, £8,125,000.

The A.A. and M.U. Opposition.

In a minority report, the Secretary of the A.A. and M.U. puts up a strong opposition to the recommendations of the

opposition to the recommendations of the rest of the Committee, from the views o which he dissociates himself.

"I am convinced," he says, "that the proposal to remove the petrol duty and substitute a heavy initial tax at a time when the whole motoring industry and community is in an unsettled condition i directly opposed to the interests of the country, and will have a disastrous effect on the development of motoring.
"In dissenting from the decisions of the Committee, I am influenced by succonsiderations as: That despite the proposed heavy increase, which presumably

posed heavy increase, which presumable is intended to include the petrol tax paid by the motorist, the Government ar clearly unable to give any guarantee tha

Taxation .-

when the duty is removed the petrol groups will give the consumer the benegroups will give the consumer the bene-it of any permanent reduction in price. That the removal of the petrol duty utomatically withdraws the preferential treatment rightly accorded to benzole, he chief home produced fuel, and thereby strengthens the already powerful grip of the petrol groups upon both industry and user. That the heavy taxation progosed will discourage motoring, resulting n a reduction in the output of new cars and the restriction of the use of hose already existing, with a consequent

oss of revenue.
"Not only do I disagree with the principle of the scheme recommended, out I question the method upon which rrived at, particularly in relation to private motor vehicles. The total sum equired for road purposes is stated, and the individual tax is calculated in un estimate of the total number of rehicles likely to be in use at midrenties likely to be in use at inde-ummer this year. It is, however, the ntention that the proposed new taxes vill not be operative until 1921, in which rear the number of vehicles will have creatly increased, and the individual contribution to the total sum required

contribution to the total sum required would be much smaller.

"In spite of the arguments raised, still maintain that as long as this pecial taxation of vehicles for road evenue is existent there is no possible." ustification for imposing the urden of such taxation on one particular lass of road user, and that all classes f vehicular traffic should contribute heir proper quota for road purposes.

The A.C.U. and Taxation.

The following letter has been received rom the secretary of the Auto Cycle Jnion explaining the views of this body: To the Editor, The Motor Cycle.

Sir,—By the time this letter appears a print, motor cyclists will probably ave learnt how the Government prooses to tax them, and the report of the committee, on which the Chancellor will resumably have based his proposals will

ave been made public. There is little doubt but that the proosed taxes will be worse than unpopular. hey will be regarded as unfair, and notor cyclists will want to know what ne Auto Cycle Union has been doing for nem during the past few months, and hat it proposes to do in the immediate

The A.C.U. has, ever since April, 1916, hen it successfully fought Mr. Mc-enna's proposal to tax motor cycles on false basis of horse-power, taken up a onsistent attitude. In the first place, ne Union objects on principle to any axation of road-using vehicles. The bads are a national asset, their constituon and maintenance should be paid for y the nation, and their use encouraged and not restricted. Such a view is dmittedly Utopian, and of no practical alue at the present moment.

If it is agreed that, in the present anditions of our national finances, road sers must be taxed, then the A.C.U. ibmits:

All road users must bear their 1 fair share of taxation.

2. The whole of the money obtained from the taxation of road users should be spent on the roads.

3. The amount to be paid by each a individual road user should be proportionate to the use his vehicle makes of the roads.

During the last six months the Union has been actively engaged in submitting practical proposals embodying the above principles through the Motor Legislation Committee. The most important of these submissions has been that the petrol tax should be retained as by far and away the fairest means of apportioning the tax on all motor vehicles. All rebates, etc. should be swept away, and there should be a flat rate of 4d, per gallon on all motor spirit used by mechanical road rehicles of every description.

The A.C.U. Suggested Schedule.

The Government have a mysterious

objection to taxing petrol.

Anyhow, the authorities have so far remained adamant in their refusal to entertain the one fair and practical way of taxing motor vehicles, and have asked for alternative suggestions. Very reluct-antly the A.C.U. has suggested an alternative to the petrol tax. It gave the strongest reasons against taxing motor cycles on the obsolete basis that it is proposed to retain for motor cars, and has suggested that if the present £1 per annum and 6d. per gallon petrol tax is removed the least objectionable system would be for :

(a) Solo motor cycles exceeding 200 lb. in weight unladen, £2 15s. per annum, payable quarterly if

(b) Solo motor cycles not exceeding 200 lb. in weight unladen, £1 10s. per annum, payable quarterly if desired.

(c) The right to attach a sidecar

or trailer to the above. £1 per annum, payable quarterly if desired.

(d) Three-wheeled cars, £3 15s. per annum, payable quarterly if desired

The A.C.U. recognises that there are sound and inseperable objections to any system of taxation which, such as the above, is not proportionate to user, and reiterates that the only practical method of so proportioning taxation, which at the same time bears a direct relation to the damage done to the roads, is a tax

on motor spirit,

During the next few weeks our fate in this matter will be sealed . There will be a stiff fight before the Government is compelled to adopt the petrol tax as the basis for future taxation, and the Auto Cycle Union appeals to every motor cyclist in the country for his or her support.

For the Auto Cycle Union, T. W. Loughborough, Secretary.

The Composition of the Committee.

In our leaderette on the first page of this issue we refer to the fact that motor cycle interests were not directly represented on the Government Committee responsible for the proposals. Herewith we give a criticism from Mr. Philip Runciman of the composition of the Committee, which he states is "one of the most impudent encroachments on public rights

which the present bureaucracy has ever attempted."

Sir, I have refrained until now from criticising the Government Committee set up to deal with motor taxation, for, although the composition of that body was open to criticism, it was in the national spirit to give them a fair chance, and judge them by their works. They have now published their report, and I must say that it fully bears out my worst fears.

Government Officials Predominate.

My immediate purpose is to draw attention to the extraordinary composition of the Committee which the Government called together to "advise" Chancellor of the Exchequer on this intricate matter of motor taxation. The Committee was composed as follows: Members

Government officials (including chairman) Commercial motor interest ... Motor manufacturing interests Motor users' interests ... 2 Local authorities ...

Let me point out that the report shows that the greater part of the revenue to be raised under the new scheme is to be derived from the private motorist, and let me say that, up to the present, practically the whole burden of road traffic taxation has been borne by the motor vehicle owner. Yet we find that on this Committee the private motor users have been in a hopeless minority. If it came to a vote they could be practically swamped by the Government officials alone, and whether these officials knew little or nothing of motoring they had the power by their numbers to defeat the men who have concentrated for many years on the development of road locomotion.

Strong Criticism.

In a democratic and self-governing country it is an essential principle that the public wishes should be respected in makers of taxation. This respected in flouted in the present case by a bureau-cracy which "packs" a Committee with Government officials who, acting under instructions, no doubt, recommend a scheme of taxation that has been vehemently opposed by every motor user, and indeed by every person who has any knowledge of motoring conditions.

To my mind, the composition of this Committee, and its report, form one of the most impudent encroachments on public rights which the present bureaucracy has ever attempted. The entire nation should fight it on the broad principle of public rights which have been challenged. If the Government can pack its so-called "advisory" Committees with tame officials the whole value of public committees and Royal Commissions disappears, and officialism will have a power as sinister as that possessed by the Bolshevik despot. Every motorist will fight the £1 per horse-power tax for its injustice, and the whole nation should fight it as a protest against official arrogance. Yours truly,

PHILIP RUNCIMAN. [265,000 motor cycles, 210,000 private cars, and 177,000 commercial vehicles estimated in the report to exist Mid-summer, 1920.—Ep.]

Victory Cup Trial Next Saturday.

A Large Entry in Birmingham M,C C, One Day Event.

ONE hundred and sixty-eight entries have been received for next Saturday's trial for the Victory and Midland Cups. This is a record for an event organised by the Birmingham club. The ronte includes Beacon Hill, Old Wych, Portway, and, after Innch, Rising Sun, Sudeley, and Saintbury hills, and the start is from the "George in the Tree "Berkswell at rune cycled". Tree," Berkswell, at nine o'clock.

An Important Midland Gathering.

The Seventh Annual Dinner of the Sutton Coldfield and North Warwickshire A.C.

MONGST the many go-ahead Midland clubs the Sutton Coldfield and North Warwickshire A.C. has long held a prominent position, consequently, we were but little surprised at the very representative gathering present at the seventh annual dinner held at the Royal seventh annual dinner held at the Royal Hotel. Mr. J. Allday presided, Mr. Loughborough and Major Watling representing the A.C.U. and the C. and M.C.T.U. respectively. Amongst the many well-known figures present were Messrs. Paskell, Whitworth, Lycett, Bennett, Mosedale, Alec Ross, A. Butterfield, G. and E. King, and others too numerous to mention. numerous to mention.

An excellent dinner was followed by speeches, prize giving, and a musical programme. Prizes were distributed by Mrs. Allday, and Eric Williams, the winner of the Colmore cup was the first

to be called. Following this, W. B. Gibb caused some amusement by carrying off the enormous Calthorpe trophy to his end of the table, where it was duly filled and circulated.

Amongst the interesting points men-tioned in the speeches, the question of taxation naturally occupied a prominent position. Mr. Loughborough pointed out that the success of the T.T. is practically assured. Major Watling drew attention to the formation of the Research Association, and to the importance of such a body to manufacturer and user alike. Well-deserved tributes were paid to the president and to the club officials, special mention being made of Mr. Phil Mosedale, the energetic organiser of this year's Colmore cup event

Replying to the toast of the press, Mr. Geoffrey Smith (editor of The Motor Cycle)

congratulated the club on the up-to-date organisation, and on the fact that it had nominated a rider for the forthcoming Tourist Trophy races.

LIVERPOOL OPEN SPEED TRIALS.

The open speed trials organised by the The open speed trials organised by the Liverpool M.C., consisting of standing and flying kilometres for all classes of motor cycles, sidecars, light cars, and cars, will take place on May 15th. Prior to the war this aunual event was held on Colwyn Bay Promenade, but this year the club have secured the use of a good stretch of private road with a fine asphalt surface.

Entry forms and all information can be obtained from the Trials Hon. Sec., Mr. E. F. Holloway, 36, Sandown Lane,

Wavertree.

Yorkshire Clubs Meet.

On April 25th members of the Hull, York, Leeds, Scarborough, and Harrogate clubs will meet at Farndale.

Essex M.C.

The first qualifying run for the "standard run" will be held on the 25th inst., starting from the Eagle Hotel, Snaresbrook, at 8 a.m. The standard run final will take place in September.

Exeter M.C. and J.C.C.

This club is now well organised and This club is now well organised and has a membership of over eighty. A fine programme, including three reliability trials, has been arranged. The opening run will be made to Chulmleigh, on May 8th, starting from London Inn Square at 2.30 p.m.

Newcastle and District M.C.

Mr. A. S. C. Broadway recently gave a very interesting address on "The Carburetter" to about fifty members at the club headquarters, the Grand Hotel, Newcastle.

On April 30th, Mr. Ferrier Stephen hopes to demonstrate wireless telegraphy with an installation in operation in the club room.

North Cheshire M.C.C.

Assembling at Fulshaw Cross, Wilmslow at 2 p.m., a run will be made to Millersdale for tea on the 25th. The affairs of this club are now most satisfactory, and the membership is increasing steadily. Local motor cyclists desirous of joining the club should communicate with the hon. sec., Mr. H. Broderick, Somerby, Wilmslow.

Dunheved (Launceston) and District M.C.C.

Twelve competitors completed the course in the non-stop run to Truro recently held by this club. G. Dingle finished first, being only two minutes out of time, and was awarded a silver coat-of-arms spoon. A. Henwood (Zenith) was second, winning silver plated cup, and J. H. Treleaven (James sidecar), who ran home third, gets a copy of The Motor Cycle free for six months.

Northern M.C.

This Newcastle chub has made great progress since its formation. In the last two months it has enrolled over fifty new members. Two runs have already been held, and the third is to take place on the 25th inst. The club's success is attributed to the sporting spirit of its members, and to the fact that it is not run either for the trade or by the trade, all its officials being amateur motorists.

A FINE SPEEDWAY. The Liverpool M.C. have secured the use of this fine stretch of private roadway for their speed trials on May 15th.

Meeting at headquarters at 10 a.m. on the 25th inst., a social run will be made to Dovedale, via Lichfield, Sudbury, and Ashbourne, with a lunch stop at Peveril of the Peak Hotel.

This social event should provide an excellent opportunity for members to get better acquainted.

Sutton Coldfield and North Birmingham A.C. . The hon, secretary will be pleased to see any motorist at the club room in the Crow's Nest Hotel on Thursday nights, or any information may be obtained from him at 160, Portland Road, Newcastle.

Runcorn and District M.C.

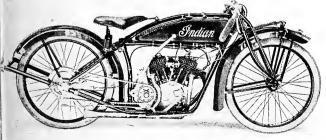

The first meeting of the above club is to be held on the 25th inst. The venue will be stated in the local press. The hon. secretary is Mr. E. G. P. Timmins, Argyll Lodge, Runcorn.

Neath and District M.C.

A fine stretch of road at Margam Park, near Aberavon, has been secured for the speed trial, organised by the above club in conjunction with the Swansea, Ystalyfera, and Carmarthen clubs, to be held on the 24th inst.

Coventry and Warwickshire M.C.

A novices' competition, open to all members who have never won a gold medal, will be held on May 1st. This event will take the form of a paper-chase, followed by a slow hill-climb. Speeds will be drawn at the starting point, Whitley Common (Railway Bridge). Prizes will be awarded for solo, sidecar, and car classes.

One of the Indian T.T. Scouts. The Hendee Manfg. Co. have entered several machines for the T.T.; the bore and stroke are 68 mm. = 594 c.c.

Club News .-

Isle of Wight M.C.C.

A general meeting of the Isle of Wight M.C.C. will be held at Sander's Restaurant, 123, High Street, Newport, Isle of Wight, on the 24th inst., at 2.30 p.m., for the election of officers and to arrange a programme for the present year.

Helensburgh M.C.C.

At a meeting, held recently, it was decided to re-form the above club. very sporting programme has been drawn up, and all motor cyclists in the district are invited to join. The hon. secretary is Mr. R. D. Thorburn, Albion Cottage, Helensburgh.

North Wilts M.C. and L.C.C.

Forty-six enthusiasts, including several ladies, turned out for the opening run to Lechlade-on-Thames. Rain fell heavily most of the afternoon, but despite this, a very merry party sat down to tea at the country headquarters of the club, the New. Inn, Lechlade. All looked forward to many enjoyable meetings in the future.

A New Club for Darlington.

Another new club has just been formed at Darlington under the name of the A.A. No. 1 Darlington M.C.C., with headquarters at the Green Tree Hotel. All members must belong to the A.A. All members must belong to the A.A. and M.U., and it is intended for the present to limit membership to twenty-four The following officers have been elected: President, Mr. W. Steggles; captain, Mr. A. Hornby; vice-captain, Mr. J. Godfrey; treasurer, Mr. E. Sheppard; and hon, secretary, Mr. J. J. Preder, E. Davis, Street, Davigator Brady, 16, Duke Street, Darlington.

Luton and Beds A.C.

Four test hills, Chard End, Studham, White Leaf, and Kop, were included in the reliability trial for the Staddon Cup, held on the 10th inst. The route was mainly on side roads between Luton and Princes Risborough, and was very rough and greasy in places, especially on Stud-ham Hill. Watches and speedometers ham Hill. were barred.

Results: Staddon Cup, W. S. Grigg (6 A.J.S. sc.), 11 secs. error; club silver medal, G. S. Davison (4 Coulson B.). medal, G. S. Davison (4 Coulson B.). The following made non-stop runs within 15 mins, of schedule, and were awarded bronze medals: J. Simpson (6-8 Res.), C. Harvey (10 Eric-Campbell), P. Child (22 Douglas), J. Wheeler (8 Ruby sc.), R. Hickman (3½ P. and M.), K. Anscombe (3½ Rudge-Multi). MOTOR (YCLE

Derby and District M.C.

A general meeting will be held on the 27th inst. at headquarters the 27th inst. at headquarters, the Bell Hotel. Already the club boasts a membership of over a hundred, though it has only been in existence about two months

Norwich and District M.C.

A successful whist drive recently took A successful whist orive recently took place at Shelling's Rooms. Eight prizes were presented, and the winners were Messrs. Richards, Cooke, William Howes, and J. F. Watts, and Miss A. Cooke; Mrs. Bigmore, Miss M. M. Nash, and Miss D. K. Bruwner. Miss D. K. Burrows.

Blaenavon M.C.C.

The first event of the year was a club Members turned out in run to Brecon. force and thoroughly enjoyed the outing. A very good competitive and social programme has been arranged, and if members support future events as well as the initial run, the present year should be a great success.

Jersey M.C.C.

Recently a trial was held over a sport-Recently a trial was held over a sporting course including several stiff hills and hairpins. E. N. Pironet (3½ Premier) made the best performance, and was awarded the David Cope Cup. Other successful competitors were F. G. Touzel (4 Trimmph), R. F. Wills (6-8 Sun-Japsc.), C. M. Landick (2¾ A.J.S.), and E. Farley (4 B.S.A.).

Motor exclists visiting the island are

Motor cyclists visiting the island are invited to communicate with Mr. H. W. R. Gurd, Sea View, Mont Cochon, Jersey.

Bedford and District M.C. and L.C.C.

An exciting paperchase over an interesting course of eighty miles was recently held by the club. Rain fell consistently, and several stiff hills were included, also a real watersplash, which caused not a little trouble. Mr. S. Crawley, the hare, certainly intended to heat the pack, and was, as might be expected, well protected in a four-wheeler. The winner was Mr. Cowley (23 Douglas). (23 Douglas).

Banbury and District M.C.C.

About fifty members and friends took part in the opening run to Stratford-on-Avon on the 11th inst. Mr. N. Blinkhorn, the vice-president, took one matograph pictures at the start, and again at Stratford, where tea was provided at the Unicorn Hotel.

Sunrising Hill, on the return journey, provided the usual amusing incidents, and, altogether a most enjoyable afternoon was spent by all present.

Dewsbury and District M.C.C.

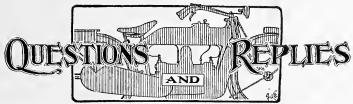

At a meeting held on the 9th inst., it was decided to form a motor cycling club in the Dewsbury district. Mr. E. Fittor in the Dewsbury district. Mr. E. Fittor was invited to the presidency, and Mr. A. K. Fitton has taken over the duties of hon secretary. Club headquarters are at the Kingsway Café, and all motor cyclists desirous of joining this club are asked to communicate with the secretary at Rookwood, Northfields, Dewsbury.

The first run (to Cawthorne) will take place out the 24th instead of the property of the page of the

place on the 24th inst. at 2 p.m.

A selection of questions of genera: interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Indor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Using a Starting Magneto.

I have a C.A.V. starting magneto, which I propose converting into a lighting dynamo suitable for fixing to a motor cycle. It is operated by means of a cranked handle and gears similar to a telephone magneto, and has the usual wipe contact and condenser. (1.) What would be a suitable size of wire to rewind the armature with, and how much would be required? (2.) Can you suggest any other way of using the magneto? (3.) What application would it be suitable for, say, on an ordinary car ?-H.E.H.

.) The C.A.V. starting magneto which ou bave might be converted into a lighting ynamo, by retaining the ordinary windigs, and substituting for the contact reaker a two segment commutator. The etailed description of this conversion is apossible in the space at our disposal. Ithough this conversion is possible, we must think you will find it altogether ie most efficient means of providing ectric current for lighting purposes. fit the starting magneto to any multi-linder car, when it would function as tended by the designer. We have used ne of these magnetos on a six-cylinder igine with every success.

Carburetter Adjustment.

Would you kindly given instructions for adjusting a analymetter which is Would you kindly give me Schebler carburetter which is attached to an American Excelsior? Recently I had the carburetter down for cleaning, and now I cannot get the best results from it, as when I start the engine it races, and when I throttle down to get steady running it stops. Therefore I should like your advice as to the best way of adjusting it.-J.B.

djust the carburetter in the following anner: Screw out the needle valve with e milled nut three or four complete urns. Close the throttle, and screw the dedle valve in as far as it will go withit forcing it. From this position unrew the needle valve once more one-id-a-half to two complete turns, flood ie carburetter, and start the engine up in the stand. Let it run until the inthe stand. Let it run until the in-uction pipe is quite hot down to the arburetter. Then, with the engine still unning and the throttle and spark each out one-third open (some models are ted with an air shutter over the in-ke, which should be wide open), screw ne milled head of the needle valve in, stch by notch. If the engine begins to run badly as soon as you start screwing this in, it means that the mixture is too weak. You should, therefore, screw it out, notch by notch, until the engine runs smoothly and without misfiring. Should the mixture be too rich, simply reverse the operation, and screw the needle in until the engine is running smoothly. This will then be found to be the correct setting for all speeds, except at full opening of the throttle. The little cam on the top of the carburetter adjusts this latter setting, which can only be correctly ascertained by actual test on the road. The machine should be tested over a given stretch with the cam set at Nos. 1, 2, and 3, when, by comparing the results, the best position can be found. This latter adjustment, however, does not in any way after the ordinary adjustment by the needle, and the throttle is seldom so far opened that this comes into action. It is most important to guard against air leaks. Before attempting to adjust the carburetter, make sure that the joints between the carburetter and the induction pipe, induction pipe and cylinders, inlet valve cages and valve guides do not allow air to leak into the induction system. To facilitate starting in cold weather the automatic air intake

should be temporarily closed by holding a duster or glove over it. The needle valve also can be unscrewed a complete half turn until the engine has become partially warmed up, after which course it must be turned back to its original setting.

Timing a Twin.

Some time ago you advised me concerning the timing of my 6 h.p. a.o.i.v. Rex, and said that if the correct setting for one cylinder was obtained the other would follow suit. This is where I am perplexed, as the engine has two cam wheels, one for each cylinder, and I do not know how to get both cylinders right .- E.T.

Looking at the engine from the timing side, call the back cylinder "1" and the front cylinder "2." Rotate the engine until the piston of No. 1 cylinder is at the top of its stroke, and insert the cam wheel so that the exhaust valve is just closing. Now rotate the engine through one complete revolution plus the angle between the two cylinders; this will bring No. 2 piston to the top of its stroke, when the valve may be timed in the same manner.

A Curious Fault.

I have an O.K. Junior motor cycle, fitted with M.A.G. engine and Amac carburetter. machine will run with both controls completely shut, but if I open the petrol lever to about half-way the engine will stop, irrespective of the position of the air lever. The engine runs very well with either less or more opening, but just at this one spot it stops altogether. Will you please explain this, and tell me how to remedy it?—A.M.S.

Without inspecting the machine it is most difficult to diagnose the trouble. It is just possible, however, that the throttle control wire has stretched considerably, so that the throttle itself, which is probably worn, passes below the induction pipe orifice, thus allowing a certain amount of gas to pass over the top. Partly opening the throttle lever brings the throttle completely across the opening, and stops the engine, while further movement beyond the half-way point allows the gas to take its usual course between the carburetter and the engine. If this is the case, it will be necessary to renew the throttle wire, as it is very unlikely that the adjustment provided will be sufficient to take up so large an amount of stretch.

Correct Fitting of Wheel.

(1.) Will you tell me on which side of the cycle (looking from the saddle) the left-hand thread adjustable cup and lock ring should be? (2.) Please explain why?-F.E.M.

wnyl-F.E.B.

(1.) The wheel when placed in the forks of the machine should have the adjusting or left-hand threaded side of the hub on the left-hand side. (2.) The reason for placing the left-hand threaded cup on the left-hand side is that, in the event of the bearings binding on the axle, the cup will tend to screw further in, rather than to run ontwards, when it would either allow the ball bearings to drop out or cause the wheel to lock in the forks. In either case the results would probably be serious if travelling at any speed.

READER'S REPLY.

Partial Seizure.

I had much the same trouble as "A.R.V." and have cured my twostroke 23 h.p. by mixing the lubricating oil B.B. with the petrol, my measure on B.B. with the petrol, my measure being one of Pears shaving soap tins full of B.B. oil to one quart of petrol, one tin of Oildag being mixed in one gallon of B.B. oil first, before mixing with the petrol. I really do think the mixing of oil and petrol is the most satisfactory method of lubricating twostrokes .- MANNMAN.

MAINTAINED EFFICIENCY

The high standard of efficiency which this fork maintains in use, has proved to be an invaluable acquisition to the personal comfort and safety of mofor cycle riders, also in minimising the wear on tyrcs, and prolonging the life of their machines as tyres, and promping the nie of that machines as a whole; and, as a natural sequence, equally invaluable as a selling point to motor cycles on which they have been fitted, with the result that the whole of our present large output is absorbed by the requirements of manufacturers who are now fitting The Brampton Bi-Flex as a standard fit-ment to their machines. Fully descriptive ment to their machines. I

ONITED STATES—The International News Associated, New York, New Yo

Trials of Concentrated Difficulty.

AST year when the London-Edinburgh run was resumed after a long interval, an innovation was made by eliminating the return . journey. The example was again followed by the M.C.C. this Easter on the London-Land's End, and the Birmingham M.C.C. adopted the same idea by running their Sangster Cup Trial from Birmingham to Barmouth, wisely cutting out a return journey so that competitors could find their own way home at leisure.

The scheme is a good one, especially when applied to these holiday week-end trials, for the entrants may wish to tour home again pleasantly, and to dally by the wayside where the scenery is attractive. Physical and nervous strain is considerable after the first fifteen or sixteen hours driving, and in consequence the inclusion of a monotonous main road return journey of three or four hundred miles at a very short interval, after the completion of an outward journey of the same length, constitutes a test of staying power more severe on man than machine.

To the modern machine an endurance run over the classic London-Edinburgh route presents no difficulties whatever, and even the London-Land's End route of pre-war days was not abnormally troublesome. However, the elimination of the return journey allows the severity of the outward run to be increased.

Perhaps of all trials the London-Edinburgh, at Whitsuntide, has proved the most monotonous, despite its classic atmosphere. In the days of fixed gears and doubtful ignition systems there was little opportunity for the rider to become bored, but the later runs degenerated into processions.

This year the route, to use a colloquialism, is considerably "gingered up," and any rider whose machine makes an unflagging ascent of Kirkstone Pass, after some three-hundred miles of steady and continuous running, may be reasonably proud. From a scenic point of view, the route will have a variety of interest, as from Harrogate onwards the competitors will see some of Yorkshire's wildest moorland scenery and gain impressions of the rolling foot-hills which lead up to the Pennines. They will see the Lake mountains gradually looming in the distance and possibly may find their Waterloo amongst them! Further North they will ride over lowland hills and valleys through a country which is unfamiliar to most south country motor cyclists.

Altogether, the innovation is an admirable one and in every way to be commended.

The Government and Fuel.

ANY months ago The Autocar urged that the Government should control fuel supplies. The object in mind was the protection of a key industry of growing importance, which is, to all intents and purposes, in the hands of the petrol ring, the existence of which is denie'd.

As we go to press, rumours are affoat that the Government is now negotiating for a controlling interest in the Shell Transport and Trading Co. If this should prove to be correct, it may form an important step towards Government fuel supply. The war has shown us the vital necessity of ample oil fuel supplies, and it is to be hoped that some satisfactory agreement will be reached. Despite the importance of the move, it must not be looked upon as the solution of the fuel problem, for there is a threatened shortage of oil fuel throughout the world, and, unless further supplies become available in the near future, this shortage is likely to become acute.

In the development of the British oilfields lie possibilities which must, however, not be overestimated. Shale oil and the encouragement of benzole production can, undoubtedly, help to ease the situation, but power alcohol would appear to be the ultimate solution, since the supply is to all intents and purposes inexhaustible.

A Problem in Duplicate.

S an exercise in theory, I am asked to propound the following technical point to readers. Two separate riders, both semi-novices, own Scott machines. Each engine misfires. Yet in both cases the separate cylinders fire perfectly evenly when the other cylinder is cut out. What is the cause?

The Black Prince Runabout.

HAVE not been able to get up north since the Show, but I intend to visit Barnard Castle at · the first opportunity, and get Archie Cocks to demonstrate the Black Prince runabout. The firm seem to have shelved their "one-plug twin" for the . moment, but the runabout is quite a new break, as the florists put it. A four-wheeler at £100 is something of a rarity in these days, and this low figure is attained by adopting a wooden fuselage as a substitute for the normal steel frame with separate coachwork, and by annexing a tip from American marine engineering practice as regards the engine. A couple of 234 h.p. Union two-strokes are coupled together, being mounted vertically cheek by jowl. This layout seems to have distinct possibilities. A pair of 300 c.c. two-strokes, which will two-stroke obediently at low r.p.m., should make a good power unit for a light machine.

Ton Miles per Gallon.

OTOR cyclists always regard their fuel consumption as phenomenal when compared with the expensive gallon mileage of cars. Of course, in positive economy we have much the worst of the comparison, as is easily proved by translating the illusive miles per gallon into ton miles, i.e., the unit for measuring the distance to which a gallon transports a given weight. The motor cycling correspondent of The Times has been dotting the "i's" of the A.A. benzole trial, in which the following figures were obtained:

16 h.p. Sunbeam car, 24.57 m.p.g., 44.22 ton miles per gallon.

3½ h.p. Triumph motor cycle, 84 m.p.g., 31.34 ton miles per gallon.

The authority in question identified five conceivable explanations of the motor cycle's inferior economy, viz., cooling, air resistance, carburation, transmission, and road resistance; and concluded that air-cooling was to blame for the 40% superiority of the car. An Autocar correspondent assails this view, and suggests that the motor cycle suffers much more from road resistance than the car. He suggests that a heavy motor lorry will give an even better ton mileage than the Sunbeam, indicating that the heavier the vehicle the better it ploughs through a holding surface. The

matter deserves some enquiry, considering that, while the Triumph figures are almost extremes (84 m.p.h. with sidecar on winter roads!), the Sunbeam figure is often beaten over short distances; for example, in the last Junior Car Club consumption trial, a 9.5 hp. Standard car, weighing 18 cwt., did sixty-four road miles per gallon, which works out at 57 ton miles: almost double the motor cycling figures. With petrol, at its present cost, we all want to know how to make the most of it.

Jointing Mediums.

NUMBER of trade firms are kindly sending me samples of jointing mediums, partly no doubt through sheer kindness of heart, but possibly with an eye to testimonials. Let me say frankly that I am not prepared to differentiate between these various nostrums. There are dozens of them on the market, and it is practically impossible to give any ofthem a preference. I never tried one which could not make a good joint; but so will ordinary commercial fish glue, gold size, boiled oil, and one or two other vulgar commodities. In motor cycling practice the making of a joint seldom depends on the special adhesive used, but rather on cleanly, mechanical. methods, and on the design of the metal parts concerned in the joint. Anybody can joint up an ordinary valve cap with any old stuff. But with certain-induction systems a mechanical genius, armed with a pot of stuff which makes birdlime seem as thin as Government beer, cannot eliminate air leaks more than once in ten tries. So I plead that this bombardment of sample tins may cease; there is no advertisement in it for anybody. Incidentally most of these patent nostrums strike me as unnecessarily expensive; I know few motoring accessories which are dearer, except the dopes which are sold for rendering goggles and windscreens transparent in fog and rain; and everybody knows that such dopes have melted platinum as a basis.

Cowling Air-cooled Car Engines.

QUITE agree with Messrs. Enfield-Allday that they have evolved the most carefully thought-out system of cowling an air-cooled engine which I have yet seen, but I think they are in error in imagining that the Palladium people and, themselves are the only firms who have adopted cowling. In actual fact, the balance is about even, for the only uncowled carengines of my acquaintance are the C.A.R., G.N., and Morgan. But are Messrs. Enfield-Allday quite accurate in all their deductions? Reference to The Autocar for March 12th, in which a 750 mile trial of the C.A.R. was described, will give them ground for believing that the uncowled C.A.R. is as well cooled as any small water-cooled engine, although its fan and air draught do not employ cowling. Similarly,

Occasional Comments .-

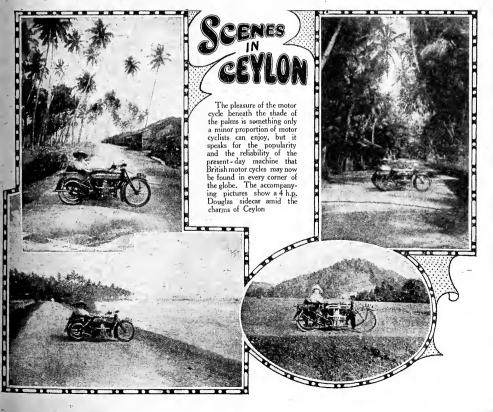

the G.N. has accomplished an engine non-stop from London to Edinburgh. The exposure of cylinders to weather, mud, and dust does not necessarily render the cooling unsatisfactory, as their letter implies; it merely tends to disfigure the car by rusty and stained excrescences, and so to prejudice potential buyers against the new cooling. To my mind, if efficient design be taken for granted, the question whether to cowl or not to cowl resolves itself into a battle between the superior appearance of cowled engines and the superior accessibility of uncowled engines. An aircooled engine can hardly be better cooled than the, uncowled C.A.R.

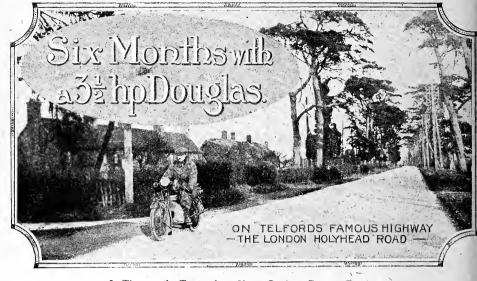

The New A.B.C.

PRODUCTION now seems to have begun in the Sopwith factory, and the agents' windows at last afford country riders a chance of seeing this most interesting machine. One or two further modifications are noticeable. Difficulties have been encountered in connection with the proposed gear box drive for the speedometer, which is now operated off the front wheel in the ordinary way; and the kickstarter is not at present being supplied, though I understand that purchasers will be given the option of buying one as an extra in about three months' time. The machine attracts keen attention wherever it goes, and its acceleration is quite of the Henderson or T.T. Norton type,

Soldering Outfits.

YERY motor cyclist should stock a bantam soldering kit of the Tinol or Fluxite type. The art is easily learnt and is extremely handy for repairing Bowden wires, petrol and oil piping, etc. Moreover, it is absolutely essential where electric lighting outfits are used. In many such outfits the final copper cables are soldered into short plugs for attachment to the lamp sockets. This system gives little or no trouble on a well-sprung car, for the wire is not subjected to any special strain if an owner handles it carefully, though even on cars the cables will not always stand repeated removal from the lamp But on most motor cycles there is a fair amount of vibration to be reckoned with, and the brittle cable may have no real support for an inch or so below the plug. Fractures at this point are not uncommon with certain types of fitting, and as they may often occur at awkward times I would not own an electrical outfit unless I carried a pocket soldering kit and knew how to use it.

A Thorough Test of a New Spring Frame Design.

T was during the 1919 Six Days Trials that we fell to the charms of the 31/2 h.p. Douglas. Though we had closely followed its progress while other work claimed our attention, it was not till the first big post-war reunion of motor cyclists at Llandrindod Wells that we fully appreciated its many Perhaps it was the Welsh surfaces that clinched the argument in favour of the spring frame, whilst the engine, "just a little bit larger," proved a great attraction for an enthusiastic rider of a 234 h.p. model. Next came the vital question of delivery. Owing to the fact that the model was experimental and a few sets of parts existed, it was not long before we "took over" at Bristol. Before leaving, we were given to understand quite

clearly that the machine, in its existing state, embodied several features which were more or less experimental and might be considerably modified before reaching

of possession, and early the following morning we set off to Coventry for the first trip.

Business at Malvern led us to deviate from the direct route. though the bumpy surface of the Bristol-Gloucester road was sufficient to demonstrate the excellence of the rear springing. While in the neighbourhood of Mal-

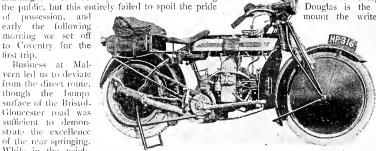

vern, the temptation to try the new machine on the Old Wyche cutting overcame us, and, in spite o the fact that an experimental carburetter was fitted which would not run with the throttle more that half open, the ascent was accomplished with ease.

Since this preliminary journey, and with the exception of one week, when at the makers' request the machine was returned to the works for the fitting of a more efficient type of cylinder, the machine has been on the road daily, and the only road stoppages have been occasioned by a faulty chain link, easily replaced and a broken belt-not a bad record for the time.

Once only has the engine been stripped for decar bonisation, and on this occasion the facility with which the engine was removed from the frame by merely undoing three accessible bolts and the necessary petro and oil connections was greatly appreciated.

Without exception, the 31/2 Douglas is the most comfortable solo mount the writer has possessed; the

engine with its rolle big ends set closely together is ordinarily free fron vibration at speed, and thi absence of dither combined with the excellent front and rear springing, give an entirely deceptive idea of road speeds with the result that one travels consider ably faster than one

Fully equipped for the road. The appearance is enhanced by the aluminium Ace disc wheels.

Six Months with a 31 h.p. Douglas .-

thinks. Indeed, on one or two long runs goodly averages have been maintained without any fatigue or impression of high-speed travelling. Those who are fearful of the instability of spring frame machines should take note of the fact that both rear frame and forks are adjustable for lateral play, and that, after five months' hard work, the wear was imperceptible, and the slightest movement of the adjustment locked the frame rigidly.

Footboards, with an underscreen and sensible mudguards, keep the rider reasonably clean, but the addi-

tion of a combined leg shield and underscreen, with the latest type of aluminium Ace disc wheels, have combined to make a wonderfully weather-proof and easily cleaned machine. Incidentally, it may be added that the disc wheels have caused no inconvenience after the first day or two.

Refinements.

Oil is fed to the front cylinder only by a small vane pump driven by gear from worm intermediate timing wheel, the flow being controlled by 'a needle valve and sight-feed indicator. Once the drip has been regulated correctly, one can forget about lubrication, except for a prolonged blind or long steep hill, when a partial turn of the needle valve is all that is required.

The magneto can be removed— by merely slacking two set pins: The clutch is remarkably sweet in action and has a

very light pull for the handle-bar control. The gears change easily and are quiet in action, and the twelve inch armoured toolbags mounted on either side of the sprung carrier enable one to carry a reasonable supply of tools and spares without fear of damage from road shocks.

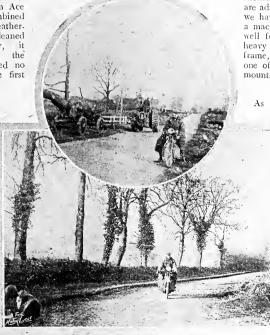

The main frame lugs are made from steel forgings, instead of the more usual malleable castings, and grease cups of sensible proportions replace oil fillers wherever practicable. One other feature seldom included in a modern specification is the adjustable pulley, which is the greatest boon to one who rides in all weathers and in all parts of the country, and, incidentally, furnishes an easy way of taking up a slack belt, provided that the belt is not already at the top of the pulley.

It is not easy to criticise a "hand made" experimental model without giving an unfair idea of the final article, so that it should be remembered that the following remarks apply to the actual machine delivered to us in October, 1919, and not to 1921 models, which, we understand, are to be modified. First, we would recommend a rin, belt in place of the present 7/8 in. belt now fitted. Next the rear mudguard, which moves with the sprung rear wheel, requires better support, and more room should be given to facilitate wheel removals, and, thirdly, the foot brake is capable of considerable improvement: beyond these points and the silencing arrangements, which are admittedly in a state of flux, we have nothing but praise for

beyond these points and the silencing arrangements, which are admittedly in a state of flux, we have nothing but praise for a machine which, with its seat well forward, 26 ×2½in. extra heavy tyres, and excellent spring frame, may be considered as one of the most luxurious solo mounts ever produced.

On the Road.

already stated, the machine is faster tlian would appear from first impressions, and, though the maximum attainable speed has not been tested, it is such that the machine has never yet been all out on the level, except for occasional bursts when carburetter testing. etc. Most of the Midland test - hills. such as Sudeley, Gambles Lane, the Edge Hills, the Old Wyche, and suchlike, can be ascended with consummate ease, and we cannot help expressing the opinion that, when the 3½ h.p. is placed on the market in

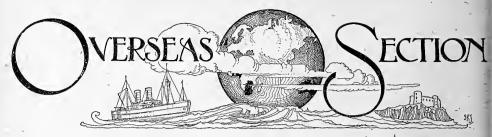

(Top) The Douglas on a fine stretch of road near Dunchurch. (Lower) Ascending the "easy" side of Newnham Hill, near Daventry.

ultimate form, it will-enjoy a popularity even greater than that of the 234 h.p.

The machine has been equipped with a four-volt forty ampère accumulator carried in a strong wooden box on the left-hand footboard. The current is supplied to a half-watt bulb in a Hunt head light, and has provided a satisfactory source of illumination for short evening runs throughout the latter part of the winter.

In conclusion, it may be added that the 3½ h.p. is fully capable of sidecar work, as has been demonstrated by works machines, but, in spite of the natural desire of a family man for occasional passenger-carrying, the writer has so far refrained from any form of passenger attachment.

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

THE new scale of taxation which is likely to come into force in 1921 will hit motor cyclists hard. There are many who own old machines, picked up for a song in pre-war days, which, by means of careful attention, are capable of conveying a sidecar containing as a rule the wife and family. These outings take place only on

occasional week-ends, and the total annual mileage is very small. To such as these a £4 tax will form the last straw, and the faithful mount will have to be sold or laid aside till better times arrive. To some degree buyers will be restrained from purchasing new mounts on account of the combination of high prices and increased taxation,

but the majority of motor cyclists will remain motor cyclists in spite of all. If British manufacturers could succeed in turning out a surplus due to a decrease in sales-an unlikely occurrence-they would be forced to divert a greater proportion of their products Overseas.

161 161 161 The Results LOOKING around the of Suggestion. machines gathered together at the start of

any big competition, one is immediately struck by the change in modern motor cycles. Big wheels, big tyres and tanks, spring frames, and rigidly constructed motor cycle and sidecar chassis are the order of the day. Urged by our Overseas readers, we have never failed to

emphasise the value of these features, and the results are now beginning to show, though they have naturally taken time to develop. It is rather curious to note that, while tyre sizes in this country are steadily increasing, those in America are decreasing. This, cf course, refers to outside diameter; the tyre sections of both countries tend to increase.

Flexible A SIDECAR chassis must be strongly con-Sidecars.

structed if it is to withstand the severe strains to which it will be subjected, but the matter of sidecar attachments has not yet reached its full development. Flexible sidecars were tested

and discarded in this country many years ago, but rigidly attached sidecars are very hard on cycle frames, and it seems not improbable that semi-flexible attachments will be developed before long. The advent of spring frames will hasten developments along these lines, but in-the meantime a well-sprung sidecar wheel goes fartowards solving the

problem.

SIDECARING IN EGYPT. An Ariel outfit posed in contrasting surroundings-a typical native mud hut and the Sidi Gaper Mosque, Alexandria.

Gear Ratio. It is a curious fact that many big reliability trials are far more suited for testing machines destined for Overseas use than for work in the British Isles. In spite of the evil road surfaces frequently encountered in post-war days, no ordinary tourist requires a mount to climb such hills, for instance, as Aultnaharie. Nevertheless, the inclusion of really severe hills and bad surfaces is necessary in order to eliminate weaklings, and to form a test for reserve engine power and brake efficiency. Such tests have, however, led to the bad practice of gearing standard machines too low for their normal work. In England the average rider does 90% to 95% of his work

on top. Why, then, some ask, pay for the weight and complication of a three or four-speed gear box? It is not suggested that three or four ratios are undesirable, but, rather, that the top gear should be higher and the lower ratios in proportion. Gear changing on the modern motor cycle is so simple that the veriest tyro can hardly make a mistake.

Overseas Section .--

Passenger At the present time an interesting Machines. situation has arisen with regard to the future of the light passenger vehicle. Sidecar machines of 1,000 c.c. are only really

necessary in a few districts of the home country, and they have become so luxuriously appointed and so fully equipped that their prices have soared past those of the cheaper and lighter three and four-wheelers.

Now, it requires a very enthusiastic motor cyclist to deny himself the extra comfort and protection of a proper seat, with screen and hood in case of bad weather, and it only remains for the runabout to prove that it can do the work of the motor cycle at the same cost.

The public is much interested in the problem, and 1920 should be able to provide a fairly satisfactory answer. There are many who maintain that it would be a simple proposition to turn out a two-seater at a lower price than a motor cycle and sidecar, and though the designs might be somewhat unorthodox it does not follow that they would be any the less sound.

0 0 0

Competitions. THE competition programme for 1920 has already been arranged, in so far as the more important events are concerned, and a bright and interesting season is assured provided that labour troubles settle quickly enough to allow manufacturers to produce their new models in time for forthcoming events.

The amalgamation of clubs to run a big event in each district is desirable in every way, and signs are not lacking of a tendency in this direction; indeed, a fusion has already occurred in more than one case.

Trials are a healthy stimulus to the trade provided that they are well-organised, but the A.C.U. has done well in limiting the number of open events, as fewer trials better run are undoubtedly preferable.

A Selection of Letters from Readers scattered all over the World. Motor Cycles in Portugal. Prices in India.

Mn. F. S. Rowe, Lisbon, Portugal, discusses tyre valves: "Having bought a new 28 x Jin. inner tube of Dunlop make from the agent in this city, I was astonished to find that the valve was of the pedal cycle type. As all the motor cycle tyre pumps in use in this country are arranged motor cycle tyre pumps in use in this country are arranged to fit Schrader (car type) valves, is it not damaging to British firms to attempt to sell material which the buyer would find great difficulty in using?

"Why not adopt the Schrader valve in England, anyway?
With its double seal, it is much safer than the other type.

"The Americans are doing a tremendous business here in motor cycles. Why are no British machines being offered?"

Pillion Riding in New Zealand.

One of our correspondents in New Zealand evidently sees humour in the attitude of the majority of people in this country anent pillion riding. He sends a photograph of his American Militaire machine (unfortunately, unsuitable for reproduction), which he uses as a solo mount and sometimes carries a passenger on the rear mudguard. He writes as follows: "I am amused at the excuses put forward by your correspondents who are anxious to abolish pillion riding. Are or were they ever motor cyclists, or are they simply looking for trouble? They are evidently made of different stuff from the Colonials, as out here it is an uncommon sight to see a cyclist touring alone. It is always two up, and it is not uncommon to see American big twins loaded up with three. My present machine is an American Militaire four-cylinder. It has no pillion seat, but I can carry a passenger on the rear mudguard."

American Flat Twins in the Argentine.

A correspondent living in Buenos Ayres says: "I recently purchased an American flat twin for £85. Some machines recently arrived in the Argentine, and were all snapped up at once. I have not had mine running long enough to pass criticism on it, but it certainly strikes me as being a pass criticism on it, int it certainly strikes me as being a very sound proposition and exceedingly cheap at the price. I think it will be a very long time before English manufacturers can market a similar model at this price out here. A 1913 fixed gear single-cylinder clutch model English r.o.tor bicycle cost 650 dollars about a year ago, and now none are to be bad. A popular English single-cylinder is about the only British machine to be seen out here in any numbers, nd taken all round these machines are very unsuitable for and taken all round these machines are very unsuitable for the work they have to do. I had one before I got the American mount, and found it impossible to do any serious long-distance riding, as the machine was quite incapable of standing up to the frightful roads in this country. I wad all the letters published in the Overseas section of The Motor Cycle with great interest, and back up the necessity for a real colonial model motor bicycle of English manufacture. But I must admit that unless they are practically the same price as the American machines, they would have no sale here. A 7-9 h.p. Harley only costs 1,050 dollars, which, at the present rate of exchange, is under £100.".

In sending us a Triumph agent's advertisement which appeared in the Calcutta newspapers, an Indian correspondent draws attention to the prices of these machines, i.e., 1,400 rs., which at the present rate of exchange represents 2165 6s. 8d. "I believe," he writes, "the current price of the same model Triumph in England is £97 (plus some per cent., which does not bring it over £110), and I think that the Association of Motor Cycle Manufacturers might take

the matter up and see if anything can be done,
"There is a magnificent market in Calcutta for all makes of English machines, but all we see are Harleys and Indians, and it really makes one disgusted to find that our makers are not even represented, and when a specimen does appear the price is far beyond what the man who wants a motor

the price is far beyond what the man who wants a move bicycle can afford to pay.

"I should esteem it a favour if you, with your wide circle of influence, could do anything, and perhaps the Triumph Cycle Co., Ltd., and other firms could try and see if machines could be exported to India, and be sold at the English price, where the state and drive only." plus freight and duty only.

Oriental Preference.

"PLANTER," writing from Gula, Perak, F.M.S., speaks of the big potential market in the Straits Settlement: "In this epistle I do not intend to follow the usual practice of Colonial readers, and will refrain from burbling about Colonial reads, large tyres, spring frames, etc., but merely append a few notes for the benefit of manufacturers and agents, which, if they mark, learn, and inwardly digest, will save them time and money if they mean to send motor cycles

out East.
"This country and the East Indies are crowded with potential buyers—Orientals—who, with regard to motor cycles, are where we were ten years ago. To sell a motor cycle to any of these the manufacturer must note the

following:

"First, three-speed gears and chain-drive are useless; the agents out here can point to a caseful of spare chains.
"The country is as flat as a pancake, and the average Celestial never by any means adjusts his chains, and it there are no spares he is right in his antipathy to chaindrive. The American chain-drivers sell well, but then the 'service' is excellent. The manufacturer should take for his model the 1909 type of 'bus, single cylinder, belt drive, and free engine. This last is thought the limit of useful advancement.

"Secondly, the most important item of all is the handle-bars. If they resemble 'semi-T.T.,' the machine is branded. Make them narrow, lengthy, and totally horrible, and they are 'it.' The other day I tried to sell my machine: a hot stuff 2½ h.p. spring frame, two-speed, chain-driver. The bars stun 22 h.p. spring frame, two-speed, chain-driver. The bars had a bump in them, and it was a wash-out. I am on an outstation, and sometimes get the dry heaves, but *The Motor Cycle* always bucks me up, and my bicycle is worth its weight in gold to me, being the only means of communication with the nearest white man."

Further Additions to the Two-stroke Ranks.

A Well-equipped Lightweight and a Machine for the Italian Market.

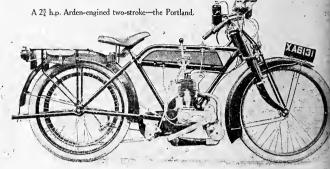

THE PORTLAND.

THE most recent addition to the existing large stock of machines at
Mandes' Motor Mart, 100, Great
Portland Street, London, W.1, is a twostroke, employing a 23 h.p. Arden engine unit, which has been placed on the market by this firm. The machine will be offered to the public at a low figure. The Arden engine unit has been previously described in The Motor Cycle, but an Amac carburetter and a Best and Lloyd lubricator have been standardised. The Albion two-speed gear box is used.

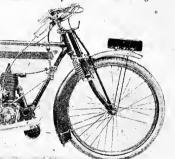

Spring Footboards.

Appearance has been improved by slightly tapering the tank, and the saddle provides a very pleasant riding position. A feature in the design of this machine which greatly adds to the rider's comfort is the spring footboards. The rear ends of these are pivoted to the rear footboard spindle, while the front spindle is provided with a sleeve, on which are two plungers reciprocating in sockets cast with the sleeve.

Saxon spring forks are fitted to the front wheel, and the equipment supplied

with the machine includes a roll of tools and a pump. The temporary chain case at present fitted will, in later models, be substituted by an aluminium casting.

The Hampstead two-stroke, a T.D.C.-engined machine, which is to be placed on the Italian market by a London firm

THE HAMPSTEAD.

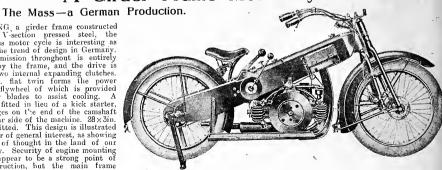

A LIGHT machine with a. T.D.C. A engine and Albion two-speed gear is to be placed on the Italian market by Messrs, Motors, 78, High Street, Hampstead.

The layout of the machine follows conventional lines, and the frame has a dropped top tube. No secondary tube is fitted under the tank, and this is a feature which is not in accordance with accepted practice..

An E.I.C. magneto is driven directly off the end of the mainshaft, a platform being provided on the off side of the crank case. Gas is supplied by a Senspray carburetter, which is clipped directly on carburetter, which is clipped directly on to the short induction stump cast integral with the cylinder wall. Druid spring forks are used, and the handle-bars are of the semi-T.T. pattern. No doubt on account of the forward riding position provided, the two-speed gear control is mounted on the front down tube of the frame, where it will be within convenient

A Girder Frame Motor Cycle.

AVING a girder frame constructed of V-section pressed steel, the Mass motor cycle is interesting as showing the trend of design in Germany. The transmission throughout is entirely enclosed by the frame, and the drive is through two internal expanding clutches. A 7½ h.p. flat twin forms the power unit, the flywheel of which is provided with four blades to assist cooling. A handle is fitted in lieu of a kick starter, and engages on the end of the camshaft on the near side of the machine. 28×3in. tyres are fitted. This design is illustrated as a matter of general interest, as showing the trend of thought in the land of our late enemy. Security of engine mounting does not appear to be a strong point of the construction, but the main frame should be both light and strong.

A desi- n permitting the total enclosure of the transmission within the frame

AMONG THE ACCESSORIES.

A Selection of the Latest Ideas in Motor Cycle Equipment

EVERY week sees a large number of new accessories on the market, and the pressure upon our space compels us to deal with them briefly. In the majority of cases, however, very little description is necessary, since the illustrations are adequate in this respect.

illustrations are adequate in this respect.

Three types of horns are illustrated—an electric model by the Apollo Plug Co., Moseley Street, Birmingham; a mechanical horn by S. Smith and Sons, Great Portland Street, W.1; and a new type of bulb horn, which has been placed on the market by A. W. Gamage, Ltd., Holborn, E.C.4. The lastmentioned has a straight trumpet, in which he sound issues from the reed and through an inmer cone, thus obviating the use of several

twists.

In leather goods, there is a In leather goods, there is a useful draw type valise for the carrier and a spare tube container, both marketed by Dunhills, Ltd., Enston Road, N.W.1, and a belt for the motor cyclist who carries a passenger on the pillion, which is sold by Macklins, 157, Dale Street, Liverpool.

The "Vibra-tomic"

The "Easy" adjustable eat for juvenile side-A Smith mechanical car passenger, horn.

Apollo

electric horn.

Sidecar owners will be interested in the Sidecar owners will be interested in the adjustable and collapsible child's seat introduced by Mr. A. W. Ayden, 63, Walm Lane, Cricklewood, London, N.W.2. This seat provides the option of three positions, and, when in a collapsed position, measures only 18×9×6 inches. Its weight is 6 lb. Another sidecar accessory is the Arco folding grid for fixing to the sidecar hody. It is of

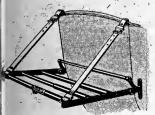

for hxing to the sidecar hody. It is of telescopic construction, permitting it to be fitted to bodies of varying width. The aluminium number plates illustrated are sold in sets of numbers by Arthur Gough, 173, Brond Street, Birmingham, and when fitted to the usual number plates the fixing rivets are not visible. 21s. is charged for three sets, 2s. extra being charged for fitting.

Dunhill's valise, size $15 \times 7\frac{1}{2} \times 6$ in., which sells at 30s."

Arco telescopic grid, for which £2 2s. is charged. -

An Atomiser.

Intended for fitting to any existing make of single jet carburetter, such as the B. and B. or old pattern Triumph instruments, the Vibra-tomic atomiser illustrated is marketed by Vibra-tomic, 107 Vivis P. Devel Position. 103, King's Road, Peckham, S.E.15. It consists of a small tube, chisel-shaped at the npper end, on the outside of which is a loosely fitted spiral spring. On the flats of the top portion two slots are cut, over which are balanced two fine mesh gauzes secured only at the top. Suction in the jet causes the petrol spray to issue from the slots and impinge upon the two gauzes, which are vibrating in the air stream.

A means to lock a motor cycle stand has been brought out by Morgan and Green, 24, Chancery Lane, W.C.2, and the construction is clearly shown in the accompanying sketch.

The Manchester Welding Co., of 20, Hardman St., Deansgate, has introduced a silencer on the vortex principle, in which the use of baffles is eliminated.

It is well-known that if the hot exhaust gases can be reduced in temperature and pressure to those of the atmossilencer under review aims at cooling the gases by its internal arrangement.

Macklin's safety belt.

Morgan and Green's stand lock.

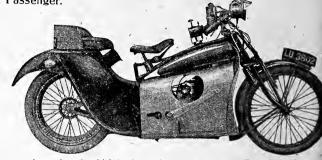

A silencer on the vortex principle.

A TANDEM-SEATED MOTOR BICYCLE.

A Motor Cycle designed to give Increased Comfort to the Pillion Passenger.

DETAILS of a striking new design have been placed in our hands, the salient features of which mark a further step in motor cycle construction, which will help to make the two-wheeled vehicle a comfortable and clean mode of transport for two persons. Judging from the mudguarding and engine protection, the general lines of the frame, and the proposed engine and transmission, it should secure a popular market amongst the high-powered touring motor cycles.

the mudguarding and engine protection, the general lines of the frame, and the proposed engine and transmission, it should secure a popular market amongst the high-powered touring motor cycles. The illustrations depict the first experimental model, designed by Mr. Arthur E. Hagg, 151, Audley Road, Hendon, London, N.W., who has held the post of assistant chief designer to the Aircraft Manufacturing Co., of Hendon, where this machine was constructed. The object of the designer has been to provide a machine equipped with an engine of adequate horse-power to carry two persons and luggage in comfort without reducing the handiness of the machine for use as a solo mount. As the provision of an additional seat forms one of the principal features, stability has received considerable attention. The improvised pillion seat placed on the carrier of a solo machine often necessitates, very cautious control, because the passenger's weight is largely in the rear of the back axle. This disadvantage has been rectified in this machine, and, moreover, the lateral stiffness of the rear suspen-

An experimental model designed expressly to carry two persons. The enclosing of the power unit and transmission has been effected quite satisfactorily

in the photograph, the twin air-cooled cylinders will be placed vertically side by side. The exhaust ports face a hole cut in the front shields, the draught through which, aided by the partial vacuum created by the air rushing past apertures cut in the engine cowling, will ensure adequate cooling of the unit. Detachable cylinder heads will be fitted, whilst the construction of the cylinder, types of which have been tested for a considerable time, will provide a high power output and

prolonged efficiency. A three-speed gear box will be contained in the crank case casting, having the lay-shaft constant mesh pinion in direct engagement with a pinion mounted on the crankshaft. The final drive to the rear wheel will be by a short enclosed roller chain in lieu of the belt fitted to the experimental model.

A special type of ignition will be standardised, which will also provide the source of illumination for the electric lighting equipment.

ment.
A 3½ h.p. Precision
two-stroke, having a
bore and stroke of
74×81 mm., 350 c.c.,
has been utilised in
the experimental
model, and is held in
position by plates
fixed to the centre of
the steel undershield,

on either side of which are fixed the footboards. A Burman gear box is mounted on a steel platform fixed to the undershield.

The construction of the frame provides a comfortable and low riding position. Two tubular frame members, which are held to the front end of the under pan, extend diagonally to the rear, and are fixed to an extension of the rear end of the tol tube (see fig. 1). Two similar member are fixed at the same point on the under shield and form the attachment to the steering head. In place of the

Fig 1.—Rear suspension system and undershield. Observe the unique frame construction

usual saddle tube is a triangulated construction, the top member of which forms a horizontal seating for the saddle Steel stampings are used in the existing rear suspension, and will be used to are even greater degree in the final design. Located vertically below the saddle, is an enclosed coil spring, housed in a steel cylinder. A sleeve around this attached on either side to the rear

A rear view, showing how effectively the mudguarding has been carried out,

sion system forms one of its most striking features. A low centre of gravity is obtained by housing the engine at the lowest possible point, and a 5ftt wheelbase renders it stable on greasy

An 8 h.p. overhead valve air-cooled engine will be fitted to the machine when marketed in place of the two-stroke shown

, Tandem-seated Motor Bicycle .-

ork stampings, and the whole is capable f a reciprocating movement which comresses and expands the spring. ircular member is placed between, and secured by rivets to the two stampings, he centre of which forms the fulcrum only, which consists of two studs pro-ided with grease cups. These studs re held in position by the rear side hields, attached to the frame below he saddle and to the rear ends of the ndershield. The rear member (fig. 2) ombines the mudguards, carrier, and illion seat, the latter being mounted in flanges and adjustable.

The gear operating mechanism (fig. 5) somewhat unique. As may be seen in the illustration, the selector rod protrudag from the top of the gear box is conjected by a rod and lever to a horizontal

spindle, held in bearings fitted to the Laterally attached to the undershield. spindle at the front end is a lever provided

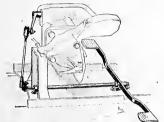

Fig. 3.-The loot-operated gear control

with a pedal at either extremity, which latter emerges through slots cut in the engine cowling. Pressure exerted on the near side pedal engages the low gear and on the off side the top gear. The neutral on the off side the top gear. The neutral position is, of course, provided when both pedals are horizontal. A ratchet device will, in the later models, be provided for retaining the pedals in any required position. A hand-operated clutch is used and a neat hand-starter is attached directly to the kick-starter spindle.

Access can be obtained to the engine by releasing the spring clip on the top of the cowling and by withdrawing two long bolts, when the shields may be totally removed.

During our trial run on this machine the absence of rattle was noticeable, though a higher-powered engine was required for general utility.

A Duplex-framed Scooter.

The G.S.C. Autocyclette, which has a Rigid Frame with Spring Insulation for the Rider.

A NEW design by Capt. Smith Clarke, who has been responsible for the lay-out of several well-known scooters, as just been completed. An experimental model was recently demonstrated o us by its maker, Mr. J. W. Clarke, of llenvoy, Waverley Road, Kenilworth, nd it appears to have several advantages truction is exceedingly simple, and acilitates assembling. It is completely riangulated, and a minimum of brazing s used in building, most of the tubes eing detachable and secured by bolt nd unt fixings,

Owing to the fact that the frame con-ists entirely of completed triangles, the ixing by bolts and muts through the pices of these is in no way detrimental o the continued stability of the frame, s each member is in direct compression nd tension, bending stresses being liminated.

- A Long Steering Head.

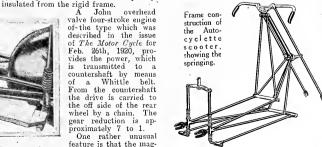

An objection to many scooter frame lesigns is that the steering head is very hort, and this may seriously affect the teering. In the frame under review, towever, the steering head is of excep-

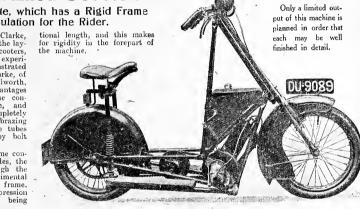

It will be noticed that two tubes are pivoted on the lower front cross member. one on each side of the main frame, and these are connected to two springsupported vertical rods working in guides, which form an integral part of the rear fork ends.

The vertical rods carry the support for the saddle, the upper surface of which is only 24in. from the ground. The long pivoted tubes carry the footboards, and in consequence the rider is completely

neto runs at engine speed, being connected to an extension of the main shaft by a coupling; consequently there is an idle spark when the piston reaches the top of the exhaust stroke. This arrangement is adopted in order to simplify the power unit by eliminating a separate transmission to the magneto.

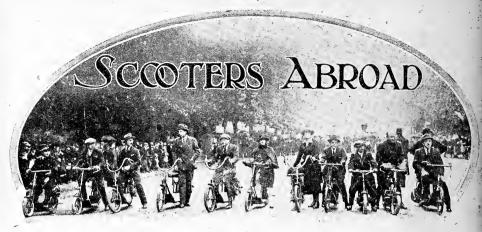

The size of the wheels is $18 \times 2in$, Palmer cord tyres being fitted, and the machine will be sold at about £50.

he transmission will impletely enclosed.

In the production models

Competitors lined up ready for the speed event in the Park of St. Cloud, Paris

A FRENCH TRIAL FOR MINIATURES.

THE first motor secoter trial ever held in France took place in the historic park of St. Cloud on April 18th, and was witnessed by big crowds, attracted probably as much by the amounteement that well-known actresses would be among the riders as by the machines themselves. Among the well-known artistes taking part were Miles. Mistinguette, Guyta Dauzon, and Myrtho Lavérne; M. Chavenal also took part.

Varied Tests.

There were three distinct tests, namely, a 220 yards hill-climb, with standing start; a speed test on the level, distance 1,093 yards, with standing start and finish and three sharp turns; and, finally, a driving test. The fastest machine on the hill was a Lumen driven by Dieudonné, which covered the 220 yards in 26§s. The second and third machines were of the same make. The Lumen is a French machine, fitted with a little overhead valve single-cylinder engine. In the speed test on the level, which also called for a considerable amount of flexibility as well as skill on the part of

the rider, owing to the standing start and finish and the three turns, the first four places were won by Skootamotas. The best time was made by Antony in 2m. 3\xi_8.

A Trial of Skill.

The leading figure of the competition was Mlle. Schweitzer, a French girl of only fourteen years of age, who showed wonderful skill in the handling of her machine. In this test, the competitors had to pass between two rows of skittles, swing round the end one, and return the same way. Four riders (Milc. Schweitzer, Antony, Colombel, Woolf) made this run without knocking down a single skittle, and as a final test the skittles were placed closer together and the turns made more difficult. this final, Mlle. Schweitzer knocked down two skittles, and thus secured first prize, for among her competitors Antony over-turned three skittles, Woolf knocked down seven, and Colombel eight.

Final results were arrived at by adding the times made on the level and on the hill, and gave the following results:

Dieudonné, winner of the hill-climb, on the Lumen scooter.

The Institution of Automobile Engineers.

The last London meeting of this session will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W.I., on Wednesday, May 5th, at 8 p.m., when Major B. H. Thomas will give a paper on "The Electro Deposition of Iron as applied to Motor Vehicle Repair Work." This process was evolved in the Army during the wâr, and was found to result in very great economies in the saving of warn parts of vehicles, and should prove of great use in peace time.

Mademoiselle Schweitzer, fourteen years of age, winning the driving test.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

PRICES.

Sir,—At Christmas I broke the oil pump glass on the dashboard of my runabout. I wrote to the car makers for a spare, and was quoted 3s. I waited three weeks, and could not get delivery. I then went to a factor's ten miles away, and he delivered in ten days post free for 9d. Would American firms treat their clients like this?

JOHN PEEL.

Sir,—Requiring some Renold chain, I wrote to three dealers in motor cycle accessories. One quoted me 6s. 4d. per foot, another 7s. per-foot, the other 8s. per foot. The second man was charging 2s. 6d. carriage. 1s. was the actual cost.

I feel it my duty to warn your readers requiring standard parts to write round the market.

Profiteering can only be stopped by refusing to deal with

profiteers. Torquay.

PROPOSED RE-UNION OF EX-D.R.'S.

Sir,-As an ex-D.R. of the Royal Engineers, I should SIT.—As an ex-D.R. of the Royal Engineers, I should be pleased if you would, through the medium of your valuable paper, insert this letter, in the hope that it may be seen hy many of the "old hoys" who originally enlisted in the D.R.'s, with the idea of holding a reunion. I notice that many other units are doing this. I am rather surprised that we have not had something of this sort ere this, and I am sure there are others who hold the same opinion. F. CUTWELL, ex-Cpl., R.E., 73040.

GOOD SERVICE.

Sir,—A friend and I started last Good Friday on my 4 h.p. Triumph combination for the south coast, but were 4 h.p. Triumph combination for the south coast, but were held up about twenty-six miles from Coventry on account of the bearings firing in the back hub, causing the wheel to be put entirely out of action. This, I may state; was my own fault, by adjusting the cones too tightly without removing the belt. Being near to a telephone I rang up the Triumph Co. at Coventry, explaining my trouble, and immediately they sent one of their testers to the place where I was stranded, with a new cone complete. We were able to continue our incurrery with a delay of one and a half hours, and I was journey with a delay of one and a half hours, and I was charged for the new part only, nothing for the fifty miles

which had to be travelled to put the machine right.

I have had several makes of machines, but never expected the service that was shown to me this holiday time.

Birmingham. MORE THAN SATISFIED.

INTER-CLUB COMPETITIONS.

Sir,-I was quite pleased to see your leading article on

club teams in big trials.

I think that inter-club competitions should be more numerous, and I am hoping that, as a result of the discussion at the last general meeting of the Union, it may not be long before the whole of Great Britain have their centres organised and can challenge one another in inter-team competitions.

I also think it will be quite possible that the A.C.U. might not only give a club team prize confined to amateur riders representing clubs affiliated to the Union, but might also

offer a prize to the best team representing a centre on the same lines.

I am extremely pleased to notice your suggestion that no trade entrant be allowed to ride at the same time as a

member of the club team. I believe that if the trade were to stand down from competing in club trials that a large amount of dissatis-faction and lack of keepings amongst bona fide amateurs would be avoided, and clubs would be better supported. The trade could do their usual by supporting the club as members and by carrying out various duties doing the general work of the club.

S. W. PHILLPOTT.

THE REAR SPRINGING PROBLEM.

Sir,-There is no doubt that "Chinook's" article on the Sir,—Interests in doubt that difficulties of rear springing is excellent, and shows that he is in touch with both sides of the question, viz., both from a rider's point of view and the manufacturing problem, but I wonder it any one system of rear springing can beat. the following:

(1.) Everything insulated except mudguard and wheel. (2.) An almost unlimited range of springing without any alteration of chain length, allowing the use of a spring to carry an extra fourteen stone on carrier if desired.

Entirely free from side play under all conditions. Extra weight on cycle about 8 lb,

(5.) In case of a broken spring, machine can be ridden by putting springs out of action.

(6.) Very little alteration in frame design; in fact, can

be adapted to an existing motor cycle.

(7.) Wearing parts easily inspected, but dirt-proof.

(8.) Sufficient friction to stop too much liveliness.

(9.) Can be made at a nominal cost.

I do not wish for my name to appear, as I am not seeking advertisement, but would like a comparison with other systems. The above machine has been ridden 1,000 miles. It is not yet ready for the market, but we hope to have it ready in a few months. PROGRESS Southampton.

HOW TO BE POPULAR.

Sir,-May I encroach on your valuable space re the above and the research on your valuable space re the above matter. Your correspondent "B," in your issue of April 15th, states that one reason for the unpopularity of motor cyclists at hotels etc., is not tipping the staff when out at a club run or trial. I think this reason is very small, and instances are very rare, compared with my wider noted experience

Last summer I was staying at a small hotel in the West-Midlands, when a well known motor cycling club arrived for tea on its way home from a week-end trip to Llandrillo, N. Wales. The members ranged their machines outside the front entrance of the hotel, and completely blocked up the door. One produced a football from a sidecar and Shrewsbury to Wrexham, by starting a miniature football match on the road. Not satisfied with this, they kicked the ball over an adjoining wall into a private garden, dis-turbing some ladies who were having tea there. I afterwards found out that this club had made no previous arrangements for tea at this hotel on this particular Sunday afternoon. If this kind of thing goes on at all club meetings, the men concerned will soon suffer, as they will find that the general public resent such behaviour, and well behaved motorists will not tolerate it.

If certain people have been able to buy machines on their war earnings, there is no need to advertise the fact by behaving like a lot of street urchins; it is behaviour

such as this that makes for unpopularity. Birkenhead.

THE CARBURETTER FOR SCOTTS.

Sir,—I am sure that your readers who are Scott riders will have appreciated heartily "Wharfedale's" contribution in a recent issue of your excellent journal. He obviously knows the Scott from A to Z.

He has aroused my curiosity about his "hush" carburetter, and I trust he will soon be in a position to let his brotners of the road have the benefit of the discovery.

I would much like to have his opinion on the Scott carburetter. I cannot understand why the Scott people have abandoned it instead of improving upon it. It strikes me as being;

- 1. Fundamentally sound in design, with its dice-box barrel. 2. It is integral with the crank case, and is warmed up even to the float chamber by heat conducted from the crank case.
- It inhales warm air from the interior of the crank case. The only attention required is to remove the air-valve and give it a dose of engine oil every 500 miles, and to

and give it a dose of eaging on every 500 nines, and to ensure that the dash pot is lifting freely.

5. It gives 55 to 70 m.p.g. solo, according to road and weather conditions, and I have never heard of any other

carburetter doing better.

To my mind, the chief disadvantage of the Binks carburetter on a Scott is that it is exposed to the cold draught.

I find that the Scott carburetter acts satisfactorily if the magneto lever is advanced or retarded, according to speed required. Full advance at speed over 15 m.p.h., gradually applied, will give acceleration with

economy on the open road. Paisley. CLERICUS.

CARBURETTER DESIGN.

Sir,-Your correspondent, Mr. Holland, raises a very interesting point in The Motor Cycle of April 15th in connection with the theory of the Eta carburetter.

As you probably know, the theory on which the design of the Eta is based was formulated as the result of a somewhat exhaustive series of investigations carried out by Mr. Aspinall and myself (who are joint patentees in the Eta) into the general theory of carburation.

The original design was based purely on this theory (i.e., there was no preliminary experimenting), and a complete prediction of its performance was calculated. Within the limits of experimental accuracy, this prediction was proved absolutely correct, even to the exact mileage obtained —90 m.p.g. on a 3½ h.p. Rudge Multi and sidecar with petrol -except on one point, where it was absolutely wrong, for, basing our conclusions on the values obtained by other investigators for the effect of temperature on the kinematic viscosity of petrol, we expected that any considerable variation in temperature would result in a corresponding variation in mixture strength, as suggested by Mr. Holland.

As a matter of fact, in practice we have been absolutely unable to detect the slightest variation in mixture strength over the temperature range usually found in England.

The fact that the performance calculated from theory proved entirely correct in every other particular leads to the belief that the theory itself is correct, and there, therefore, seems to be some doubt as to whether previous investigators have not reached an incorrect conclusion as to the effect of temperature variation on petrol flow under the influence of a venturi pressure drop. These data are the only ones that we did not investigate ourselves, and we are about to remedy the omission.

We shall also test an Eta over a much wider temperature range than we have yet used, and will let you know the results we obtain, if you are interested. [We accept with

pleasure.—ED.]

We are carefully rechecking the theory of the Eta from a purely mathematical standpoint, but, as is frequently the case with matters that seem very simple, this is exceedingly complex, and will take some time. (The functioning of the venturi alone is affected by no fewer than twenty-one variwenter and is affected by no lewer than twenty-one variables all of which are ultimately integrated and cancelled by the injector!) The matter is only of academic interest anyway, as in practice there is no detectable variation, and that is all that really matters.

The heating up by the engine has no effect on the mixture actually supplied by the carburetter, but the heating up of the induction pipe certainly has a considerable effect or the induction pipe certainly has a considerable energine, on the mixture actually reaching the engine, as there is a large amount of deposition in a cold induction system. Running for half a minute on the pilot is quite enough to warm the engine sufficiently to give steady running on the,

coldest day

We consider that this trouble, which is not a carburetter fault, but which is more pronounced with accurate carburetters than with inaccurate ones, would be almost entirely eliminated if engine manufacturers would fit reasonably proportioned induction pipes. Most motor cycle induction pipes are far too large for the engine, with the result that at low speeds the gas velocity is insufficient to prevent the unvaporised fuel which is always present from settling on the walls of the induction pipe, and so producing an erratic mixture.

In conclusion, we are pleased to see the increasing interest that is being taken in carburation by the general motor cycling public, as shown by the number of letters on this subject which have appeared recently in the correspondence columns of The Motor Cycle, and which proves that motor-cyclists are at last awakening to the enormous influenceaccurate carburation has on engine performance.

G. WARNER PARR.

A group of Swiss military motor cyclists during mobilisation. The motor cycles are fitted with the famous M.A.G. engine, mounted on Enfield frames, with Enfeld changespeed gears. We have to thank Lt. M. Blanc, of the Swiss A.S.C., for sending this photograph

Members of the Birmingham N.M.C.F.U. at Bidford-on-Avon Much enthusiasm is shown by this section of the Union, and at most week ends a run is arranged.

RUNNING COSTS.

Sir,-The article by "W.W.S." on running costs is of great interest, and no doubt accurate, but I think it hardly gives in concise form the exact information that is desired by a person who anticipates taking up motor cycling. It is admitted that there are hardly two individual cases that present an exact parallel, but the majority of those who think of taking up the pastime have been able to beg, borrow, steal, save, or otherwise find themselves possessed of the necessary sum to cover the initial cost of the machine and its accessories, and what they want to know is how much they will have to set aside regularly out of their income to run the machine, and also, possibly, what the actual running cost per mile is in case they may be faced with the alternative of a train journey or a road journey, and wish to decide as to which is the cheaper. I think it is possible to give figures that may be relied upon to give this information with agures that may be relied upon to give this information with fair accuracy, so that everything, excepting exceptional expenditure arising out of breakages or other accidental causes not covered by insurance, may be closely estimated, and the average weekly expenditure calculated.

First, depreciation must not be taken into account. This

is too uncertain, and, if the machine is kept in repair, the ultimate loss when sold second-hand should be looked upon as capital loss, and not as part of the "running costs." The actual running costs during 1919 of my machine, a 1914 3½ h.p.

Sunbeam with sidecar, are as follows:

(a) Fixed annual expenditure, viz., insurance, licence, tax, subscriptions, (b) Actual running costs, viz., petrol, oil, tyres, and renewal of wearing 9 17 6 parts (mileage run, 4,393)... ... (c) Repairs arising out of accidental breakage and sundry other repairs 10 10 0

The greater portion of the last item was exceptional, and should not recur. An estimated annual expenditure of, say, 45 should cover easily all ordinary repairs, and, if the owner is lucky, even this sum would not be required. The cost per mile for (a) works out at .54d., for (b) 1^1_2 d., and for (c) .575d., or an inclusive total of 2.6d., for two persons, as against 3d. per mile for third-class railway fare. To compare the cost of any particular journey as against the cost of railway travelling only (b) need be taken into account, and this shows that two persons can travel at the cost of one railway ticket-a not inconsiderable saving.

As regards the figures comprising (b), the oil consumption was very heavy, and I found that I had been consistently over-oiling, due, no doubt, to over-anxiety in avoiding the other extreme. The petrol consumption was 62 m.p.g., and oil 488 m.p.g.! The oil consumption has been cut down very considerable, without any detributed of the consumption of the consumption of the consumption of the consumption has been cut down very considerable, without any detributed of the consumption of t considerably without any detrimental effect, and is now in the neighbourhood of 800 m.p.g. As regards tyres, the side-car tyre was old when the outfit was hought (second-hand). A new one has been fitted, and the old one retreaded to act a spare. Both have therefore thousands of miles of useful life before them yet. The front type has now done over 5,500 miles without a puncture, and is good for thousands more. The back tyre was replaced by a new one at about

5,000 miles, has been retreaded in readiness as a spare for the front wheel. As it is not advisable to use retreaded tyres on the driving wheel, it looks as if I shall accumulate more retreaded tyres than the front wheel is capable of wearing out. In arriving at the running cost, credit has been taken for the estimated value remaining in the tyres.

Hornsey, N.

PILLION RIDING AND SIDECAR OUTFITS.

Sir,—In the Manchester Evening Chronicle of April 13th prominence is given to a statement made by the coroner at an inquest held at Bolton enquiring into the deaths of two young men as the result of a motor cycle accident. One of the two was driving the machine, the other riding on the carrier, whilst a third person was in the sidecar attached, the

last-named escaping practically unhurt.
Without going into the details of the unfortunate tragedy, without going into the actuals of the unfortunate tragedy, may I ask you, through the medium of your columns, to point out the fallacy of the belief, which, apparently, the coroner had when he stated that he severely deprecated the practice of pillion riding, expressing his regret that there was no law to prevent it. I make this request because of its importance to sidecarists, feeling that you will agree with me when I state that the chances of accident with a pillion passenger on a combination are no greater than when riding

with passenger sidecar only.

I may here add that I have no trouble in manœuvring my machine with pillion passenger and minus sidecar either in the country, at speed, or in slow-moving traffic, though I refrained from comment when the discussion regarding the dangers attending this form of riding took place in *The Motor Cycle* a short time ago, because I do agree that since there are so many machines still in use without change gears and clutch the danger does exist, except where these machines are in the hands of experienced drivers.

.I do think, however, the time has arrived for a strong protest when a statement like the one referred to is made; for though in the case mentioned it may have been made, owing to wrong evidence, certain people, whose sole hobby is to attack the innocent and healthy pleasures of others, will is to attack the innocent and nearmy pressures of security seize this as an opportunity to obtain restrictions entirely J.M.C.

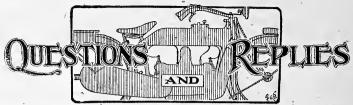

Northwich.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with The Motor Cycle.

HINTS AND TIPS FOR MOTOR CYCLISTS," Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition, Just published. Price By net. "TRACING MOTOR CYCLE TROUBLES,"
A reliable system for tracing motor cycle faults and
of remedying any trouble when tound. Fourth Edition. * Edition. "THE MOTOR CYCLE." ROAD MAPS
Envland and Wales, Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd , 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls. allowed.

A selection of cuestions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tujor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal question; should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Blow-back through Carburetter. I get a good deal of blowback

through the Amac carburetter of my 23 h.p. Singer, which causes petaol to drip from the air cone. Is it the fault of the automatic inlet valve? Please suggest.—F.B.E. The blowback through the carburetter is probably caused by the automatic inlet valve spring being too weak or to the valve being allowed an excessive lift. Not more than \$\frac{3}{2}\$ in. lift should be

Quiet Exhaust.

Having a new 350 c.c. twostroke, I do not like the noise it makes, as I have always had a more or less silent machine. I know that it can be made silent.

because I have seen machines on the road that do not make any noise. How would you deal with the engine to make it quiet? Is it the tendency that under certain conditions a two-stroke will four-stroke that makes it noisy?—
SILENCE.

If a two-stroke engine commences to fourstroke, considerable noise may be expected. It is possible that the fourstroking is due to excessive oiling. You might also try the effect of fitting a long exhaust pipe.

Overheating and Gear Slip.

(1.) What is the cause of a 6-8 h.p. Rex twin overheating with the following valve setting: Inlet valve opens top centre; exhaust valve opens to be fore top dead centre (in advanced position); lubricating oil, Vacuum "T.T."; fuel, petrol; jet, .025im.; choke tube, §in. After about three or four miles the engine will get so hot that it pulls up. (2.) The cause of the two-speed hub gear slipping on top gear. I have adjusted this so that it is difficult even to turn the engine when the clutch is disengaged.—S.T.B.

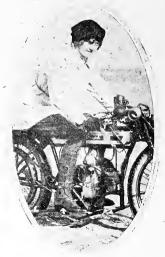

(1.) Apparently your trouble is caused by a defect in the carburetter, or, possibly, a combination of this and inadequate lubrication. We should recommend that you carefully check the petrol level in, the float chamber, and experiment with the fitting of various jets. Your valve 'timing appears to be correct, but verify the position of the piston at which the exhaust valve closes: this should not be before top dead centre. The ignition timing is somewhat late; let the points separate \(^2\)in. before top dead centre. You might also check the trans-

mission for any undue friction. The slipping gear mentioned in your second query no doubt has some bearing on the trouble. (2.) As you have already adjusted the hub to its fullest extent, it will be necessary to have the top gear band relined with suitable material, as the present lining is probably hard and glazed.

Hub Gear Trouble.

Can you tell me how to adjust the clutch of my Mark VII. Armstrong hub gear? Sometimes it will not pull out, and is worse when in bottom gear. The spindle or axle appears to be in two parts. Is that right? The clutch side moves in the back fork. The gear side is quite firm. Is this movement the cause of trouble? Otherwise, the hub appears all right, and I have no trouble with the gears.—F.K.

Apparently, the axle is broken, as there should certainly be no movement at either side. It would be best to have the hub dismantled and a new axle fitted. This trouble is no doubt the cause of the defective clutch action, and no amount of adjustment will put matters right.

Mrs. Eric Longden, wife of the well-known North-country motor cyclist, now in London, and formerly of Southport,

F.N. Tricycle.

I wish to ask a few question regarding an old F.N. four ordinder with Bosch magneto an carburetter marked "Depose Brevete." (1.) Are there as books published on this particula engine, also on the magneto and carbetter? (2.) Can I retain the registr tion number; if so, where do I.appl and what is the cost? (3.) This is three-wheel single seater. What revening the proder of the p

(1.) We should advise you to write Messrs. F.N. (England), Ltd., Kimberl Road, Willesden Lane, London, N.W. stating full particulars, and giving enginumber, etc., when no doubt they will able to give the information you requin Also much valuable information is cannot in "Motor Cycles and How Manage Them" from our publishers, 10d. post free. (2.) We cannot s whether you can retain the number; depends upon whether the previous own has cancelled it. The cost depends up the weight and will be either 5s. or 3 (5.) £1, as in the case of a motor cycles.

Fitting a Variable Gear.

(1.) I have recently purchas a 4 h.p. Rex single-cylind machine, single gear, in first-cle order. I wish to fit a gear this machine to take a sidec I do not want a hub gear, and count shaft gear would be very difficult fit, as magneto is gear driven behi engine, and platform is part of engiplates. The only method I can thi of is either eighe-shaft gear, or fit n pair of rear stays longer than those use at present with gear bracket a fit countershaft. (2.) Would a lon, wheelbase make any difference? I hi been offered a Brampton varia pulley. Can you advise me if this g is reliable? The lowest ratio I co obtain would be about 7 to 1. The ugine has plenty of power, and I owish to attach a light Watsonian si car.—F.W.W.

(1.) Provided that your engine is good tune, we think that the Brampa variable pulley will give you a nenough gear ratio, especially in voof the fact that you are only fitte a very light sidecar. (2.) Of couryou must not expect to tackle freak Is with this gear, but for ordinary everyous that the search of the side of the search of the

MOTOR CYCLE

Levis Lubrication. .

I have just purchased a 1915 Levis two-stroko second-hand, which has only one oil pipe, leading into the crankshaft, the oil pipe that should lead into the eylinder and gudgeon pin being missing. Will you please enlighten me on the following points: (1.) Is it possible to run it in this condition without harming the piston and cylinder? (2.) Whether the petroil system of lubrication, which is used on most two-strokes, may be applied to a Levis?-E.J.B.

(1.) Provided an increased quantity of oil be given, there is no reason why the machine should not be run for a short time with one of the oil pipes disconnected. We do not recommend that you use it continuously in this condition, how-ever. In any case, it should be quite easy to refit the pipes in accordance with the requirements of the oiling system provided. (2.) The petroil system might be applied; but as your engine is designed to designed by the makers, we do not think that it is advisable.

Transmission Trouble.

. I have a 1919 chain-driven 41 h.p. B.S.A. Since flushing out the gear box and re-oiling, I have had occasion to adjust the have had occasion to adjust the clutch. Now, when the engine is started up, with the machine on the stand, and the clutch let in, the runing is apparently perfect on low gear, but on second and top gears a curious joiting and jarring noise is heard, particularly when the engine is running very slowly. On disconnecting the chains, the cogs of the gear box appear to run perfectly, either with clutch in or out. The adjustment of the gears is accurate. The noise is not made when the engine is running the gears is accurate. The noise is not made when the engine is running with the clutch out. This noise also occurs on the road when travelling at low speed on second or top gears, but otherwise the machine runs well. The otherwise the machine runs well. The chains do not catch on the gear case or chain cover. Can you explain this? The machine has the usual B.S.A. carburetter. Why is it that the more the petrol lever is open the less air the machine takes? This is particularly noticeable on steep hills, when it is necessary to open the petrol lever nearly to its fullest extent, and almost to close the air lever.—E.P.L.

The jolting may be due to intermittent clutch slip, resulting from the use of an unsuitable lubricant. Thin oil only should be used. When running light on high or middle gears, jerky running may be caused by the rear wheel overrunning the rest of the transmission, but this should not occur under a normal load. You may get a certain amount of harsh running if you attempt to run too slowly on top speed. Slackness of either slowly on top speed. Slackness of either of the chains would accentuate the trouble, and it would be as well to adjust these properly. It is usual, when slimbing a hill, on top gear, to cut down the air supply as the speed of the machine falls off. You can make the carburetter more automatic by opening the adjustable jet still further, say, two revolutions of the needle from the fully closed position. You will then find that the air control is not nearly so sensitive.

Fitting a Speed Gear.

Will you tell me if a counter-

shaft three-speed gear can be fitted to a 1911 Triumph free engine model always used with sidecar?-L.G.R.

It is quite possible to fit a three-speed countershaft on to a 1911 Triumph, but it will be necessary to rebuild the back stays of the machine in order to fit a bottom bracket suitable for carrying a gear box.

EXPERIENCES WANTED.

Facilities for Welding.

We understand that the Coventry Welding and Engineering Co. of 44a, Mich Park Street, are prepared to execute all kinds of welding repairs.

Competition Rider-agent.

Rex Mundy, the well-known competi-tion rider, has secured premises at Duke Street, Richmond, where he is now specialising in the sale and repairs of motor cycles and light cars.

"Everything for the Motorist."

We have just received the 1920 catalogue of Messrs. Brook Brothers, automobile agents, Burnham-on-Sea, Somerset, an interesting booklet giving particulars of different makes of motor cycles, motor scooters, sidecars, and accessories handled by this firm.

Triplex Goggles.

A leaflet has been received from the A leafiet has been received from the Triplex Safety Glass Company; Ltd., 1. Albemarle Street, London, W.1, describing goggles comprised of Triplex glass specially designed for motor cyclists. These goggles are for lady and gentleman-videus "Triplex glass, which does not riders. Triplex glass, which does not splinter, is highly suitable for motor cyclists' use.

The Book of the Scott.

An exceedingly well produced hand-book, copiously illustrated with sketches and photographs, has just been received from the Scott Motor Cycle Co., Ltd., of Saltaire, Shipley, Yorks. The matter deals in a very clear way with everything the rider should know about his machine, and many things that the average mechanic would do well to study. In addition to the instructional portion, a completely illustrated spare parts list is included, while the final pages are suitably ruled as a log book.

New Micheliu Guide:

The latest edition of the Michelin Guide to France, now in its sixteenth Guide to France, now in its sixteenth year, 5s., has now been issued by the Michelin Tyre Co., Ltd., 81, Fulham Road, London, S.W.3. The guide is indispensable to all those who are taking their holidays this year across the water.

It remains just as excellent and useful as before the war, but naturally, owing to the increased cost of living, owing to the increased cost of imag, the prices of the hotels are not given. The hotels, however, are classified according to types. An extra good hotel is represented as having four gables, the next best hotel three gables, and the remainder two gables and one gable respectively. Even the smallest hotels in France are almost invariably good. especially if mentioned in the Michelin Guide, or if they bear the T.C.F. sign. Excellent plans of the towns are given, and information as to how to use the Guide.

American Designer Here.

Mr. Arthur Davidson, of the Harley-Davidson Co., U.S.A., is now on a visit to this country.

Climbing Snaefell.

The designer of the Manx Aurora two-stroke, Mr. J. Wilson Oates, succeeded last week in climbing to the summit of Snaefell mountain (2,034 feet). This, he believes, is the first time a lightweight has succeeded in climbing the mountain.

The Petrol Prices Protest.

Signatures to the petition to the Premier protesting against the price of motor fuel now total 1,236,627. The Automobile Association now awaits a definite date for the presentation of the petition to the Prime Minister after his return from San Remo.

A.A. Subscriptions.

On and after May 1st, car owners joining the Automobile Association will be charged an entrance fee of one guinea, in addition to the present annual subscription of two guineas. New motor cycle and cycle car members will be enrolled at the usual annual subscription of half a quinea, plus an entrance fee of 10s. 6d. In future there will only be two classes of "A.A." membership—car owners, and motor cyclists with whom will be in-cluded owners of cycle cars. These changes will not affect motorists who are already A.A. members. Motorists from the Colonies, U.S.A., and abroad, are entitled to "A.A." membership for a special subscription of two guineas.

A Candid Magistrate.

Motorists who are unfortunate enough to have to appear before the local Benches of magistrates do not always find the justices going out of their way to be sympathetic, and it is therefore all the more pleasing to report the remarks of the Chairman of the Hfracombe Beach recently, when a Coventry rider, Mr. Frank Hutchinson, was summoned for not having his rear lamp lit. His solicitor explained that, owing to the weather and the state of the road, it was impossible to keep the lamp alight, and in dismissing the case on payment of costs the Chairman of the Bench remarked that the proper people to be summoned were the county council for keeping the road n such abominable condition

THE PRICE OF PAPER.

Paper to-day costs approxi-mately five times as much as in pre-war days.

Since Jan. 1st last, paper has risen 2d, per lb., which represents an increase of over £35,000 in the annual paper bill of "THE MOTOR CYCLE."

The paper used for each copy of this issue costs over 3d., exclusive of printing and pro duction charges.

The Budget and Road Users.

A meeting of the Parliamentary Road Transport Committee took place at the House of Commons last week to consider the Budget proposals as they affect road users and transport.

Special Features.

Alcohol Motor Fuel.

Alcohol Motor Fuel.

A report of far-reaching interest to the outire motoring community will shortly be presented to the Government by Professor Harold B. Dixon. At the request of the Inter-departmental Committee of Alcohol Motor Fuel, he agreed, about year ago, to carry out a series of experiments. He had already determined the ignition points under atmospheric pressure, and also with firing by compression not only of alcohol, ether, benzole, appetrol, but of mixtures of these, takin them two together. He has given species them two together. He has given special attention to a mixture of alcohol and Professor Dixon has also deter ether. Frofessor Dixon has also determined the safe compression to use i the case of each fuel in order that ther may he no premature ignition. When the Government has decided how to make the new alcohol fuel undrinkahle a further series of experiments will b necessary to see whether the addition to the spirit which is to be adopted affect the explosive properties of pure alcohol

A motor cyclist making use of the bulk storage petrol installation at the premises of the Briston Motor Works, Ltd., 289a-291, Briston Road, London, S.W.9. Motor cycles are driven into the forecourt by one gateway and fill up with petrol, passing out through another gate.

THE WELCOME SIGN An A.A. hotel on the Oxford Road.

YOUR NEXT "BREAK"

Easter figures which show how to make the most of Whitsuntide.

In spi'e of unfavourable weather conditions during the Easter holidays there were many thousands of motor vehicles on the roads.

The A.A. Patrols were, as usual, busy directing traffic, giving road information, obtaining fuel, spare tyres, In view of the popularity of this branch of A.A. Service a few particulars of cases replacements, etc. where practical mechanical assistance was rendered will be of interest.

The Patrols helped nearly 500 members who suffered breakdowns, or temporary derangements to their cars or motor. The A.A. "Mechanical First-Aid" Machines travelled some thousands of miles, and the mechanics in charge dealt. with sixty cases of mechanical breakdown In connection with accidents which occurred during the holidays, the A.A. Patrols rendered assistance in twenty-eight cases, and the AA Roadside Benzole Filling Station at Aldermaston on the Bath Road, was used considerably...

A valuable adjunct to the Patrol Service is the AA system of roadside telephones. These instruments are installed in all patrols' sentry boxes, and the service is now available to members both night and day, a special key . giving access to the box whether the patrol-in-charge. is on duty or not,

A further facility in A.A. Road Service, and one much appreciated by touring members, is the Home and Foreign Touring Assistance furnished by the Association. Routes are prepared to suit the requirements of members touring with their cars or motor cycles in Great Britain and Ireland, whilst members going abroad are supplied with routes, also triptyques, which save trouble, delay, and expense in depositing duties at frontiers.

One of the most valued of A.A. benefits is the comprehensive scheme of Free Legal Defence. This scheme now includes free legal representation by the Association's solicitors in civil cases arising out of the use. or ownership of privately owned cars or motor cycles in addition to covering the defence of members in any Court of Summary Jurisdiction in the United Kingdom in respect of summonses issued under the Motor Car Act and other regulations controlling the use of motor vehicles.

Other benefits of A.A. membership include Engineering Assistance, Special Insurance Facilities, AA. Hotels, Appointed Repairers, etc.

In view of the coming Whitsuntide-when, it is safe to predict motor traffic will greatly exceed that of Easterall motorists are advised to join the Automobile Association without delay so that they can motor with the maximum of comfort and the minimum of inconvenience.

Send a postcard, to-day, to the Secretary, The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C.2, for a free copy of the booklet, "The Key to the Open Road," and learn how the Association can be of real benefit to you, personally

"Motor Cycles and How to Manage Them."

We are requested by our publishers to mention that the twenty-first edition of "Motor Cycles and How to Manage Them" (price 2s. 6d. net, by post 2s. 10d.) will be available in the course of a few days, also an improved edition of "The Motor Cycle Route Book" with maps (price 5s. net, by post 5s. 4d.). Copies of either of three books may be obtained from the Publishing Department, Hiffe and Sons, Ltd., 20, Tudor Street, London, E.C.4.

Speed Trials at Weston-super-Mare.

Given favourable weather the Bristol 's open speed trial on Saturday, May 8th, will prove a popular and enjoy-able event. The officials at Weston-superable event. The olineals at Weston-super-Mare are doing their utmost to make it a regular gala day. Entries are rolling in freely. Apparently this class of seaside racing is extremely popular. The com-mittee omitted to include in its programme the open class for machines not exceeding 750 c.c. and also the open exceeding 750 c.c. and also the open class for machines not exceeding 750 c.c. with sidecars; thus, there will be two more events in which many machines are eligible to compete. There is a special handicap event for ladies open to all classes and powers, and the Western Counties speed championship for a team of three machines is creating considerable interest. No doubt there will be marked ivalry and keen competition between the clubs in the West of England. The nclusion of the two additional events has made it necessary to extend the closing day for the entries another forty-eight nours, and these may now be sent to Mr. R. Bennett, 182, Wells Road, Knowle, Bristol, up till to-morrow (Friday).

News in a Nutshell.

156 riders survived the second Victory Trial of the Birmingham M.C.C. held last Saturday. Record crowds congregated to see the competitors on the test hills.

The new taxes of motor vehicles are likely to become law in the absence of collective and definite apposition in Parliament.

The inclusion of Kirkstone Pass in this year's London-Edinburgh Whitsuntide Run has given great satisfaction.

More second-hand motor cycles are changing hands than at any previous stage in the history of the motor cycle.

The Research Association is going ahead, and promises to do much to solve problems of motor cycle design.

With the Royal Scottish Automobile Club's light car trials abandoned, motor cycle competitions form the only open sporting road trials of 1920.

A rally of Midland light car owners is to be held at Stratford-on-Avon on May 8th, meeting at the Swan's Nest Hotel.

A Welsh open hill-climb is down for decision at Fiddler's Elbow to-day (Thursday).

The Football Cup Final attracted many Birmingham and Huddersfield motor cyclists, who journeyed to London by road.

There was quite a Colonial stretch in Saturday Victory Trial, between Sudeley and Broadway.

A competitor who for a wager started the Victory Trial wearing a top hat was suitably "ticked off" by one of the A.C.U. consuls at Cheltenham.

The T.T.

Latest advices would show that the T.T. will become a Wolverhampton v. America event!

The A.C.U. Six Days.

It has been definitely decided that the A.C.U. Six Days Trial this year will be held in the North-east of England, and the radiating point will probably be Darlington.

Anglo-Dutch International Trial.

The A.C.U. has decided to invite entries for the Anglo-Datch Trial. From these entries a selection will be made to provide a representative British team. Entries are also to be invited for the International Six Days Trials in France.

Important Open Speed Trials.

The joint open speed trials organised by the Essex M.C. in conjunction with the Southend-on-Sea and District A.C., will take place at Westchiff-on-Sea on July 15th. Intending competitors should communicate with the hon organiser, Mr. E. J. Bass, 18, Market Square, Bishops Stortford, Herts. Further details will be published in these columns as soon as available.

Killing Time.

The police are very active near about the fortieth milestone on the London-Birmingham Road. Last week a large number of notorists were stopped for licences, and when the police were questioned on the subject they admitted, they were doing it to "kill time." Their successful efforts at killing other people's time besides their own was not appreciated, to say the least.

AN ARDUOUS ONE-DAY TRIAL.

An Edinburgh M.C. Club Event covering Part of the 1920 Scottish Six Days Course.

EXCELLENT weather conditions prevailed on the occasion of the annual spring holiday trial organised by the Edinburgh M.C., which was held over particularly interesting course last week, inasmuch as it is the route to be followed on the last day of this year's seattish Six Days Trial.

Starting from Liberton the course ran in Broughton, Tweedsmuir, Talla Lime, and over the famous Talla Hill. Here, lespite the poor surface, several fine secents were made, including S. Miller 34 P. and M.), A. H. 'Alexander (34) Douglas), R. S. Macrae (7.9 Harley sc.), S. Alexander (8 Enfield sc.), and the wo A.B.C.'s. The run along St. Mary's coch to the lunch stop was uneventful, he road being in good condition. The iexx section included Dunaskin and Redtone Hills, Elmschurch Snout Hill, and Redtone Rig to Haddington. Again, the I.B.C.'s, Alexander (Douglas), and Miller and M.): made fine performances. Infortunately the majority of the cometions took the Garwald Road to Hadington, and the only two who finished time were R. S. 'Macrae' (7.9 Harley c.) and S. Miller (34 P. and M.). The course should provide quite a stiff

The course should provide quite a stiff ast day for the Six Days competitors, he roads being for the most part very ough, and include no fewer than twenty-hree watersplashes.

An excellent view from the top of Talla Hill, showing R.S. Macrae (7-9 Harley-Davidson sidecar) making a good ascent.

VICTORY CUP TRIAL.

156 Survivors of 165 Starters in the Birmingham Motor Cycle Club's Open Trial last Saturday. Six Difficult Hills in as Many Non-stop Sections.

The Old Wyche, Malvern, one of the steepest test hills on the route. The rider is B. Bladder (8 New Imperial sidecar).

A DIFFICULIT trial, splendidly organised, sums up the second Victory Cup trial of the Birmingham M.C.C. It was one of the twenty open A.C.U. events of the year, and 177 entries resulted. Of these, twelve riders failed to start, and 156 survived. Hills there were in abundance included, in six non-stop sections, but the outstanding event was the flexibility test up Birdilp Hill. Once the terror of motor cyclists, this Gloucestershire gradient is now an easy climb. So much so, indeed, that the competitors restarfed with ease on a steep part of the hill, and accelerated as if the road were flat. Spectators gathered at all the points of vantage, and must have outnumbered previous crowds. Many had The Motor Cycle. with the list of competitors and official numbers, and closely observed the performances.

Details of the Run.

Saturday broke dull and threatening. Machines were weighed at Hampton, while Mr. Tom Silver sealed the competitors' watches. It began to-rain about 9 a.m., when Mr. Alec Ross commenced to start the riders at one minute intervals from Berkswell.

The trial began with a nineteen mile non-stop section over the rough lanes which lie on the south side of Birmingham, and included Beacon Hill (observed). The roads were wet, and in many places covered with slimy clay. Beacon Hill leaves the main Birmingham-Worcester road a little way beyond Rubery with a sharp turn and steep gradient, which soon eases, but the surface becomes very bad, especially for sidecar machines, owing to the deep clay ruts at the sides of the road; that on the left took the sidecar wheels up to their axles and caused them to bounce horribly and drag the machine out of its course. The more astute riders kept the bicycle wheels on the centre, where the surface was fair and the sidecar wheel on the grass, but this required considerable nicety of steering, as the marrin for error was very small.

margin for error was very small.

The solo viders had no great difficulties to face, and most of them came up steadily in the middle of the road, where the surface was wet and muddy certainly, but not particularly bad. We saw one incident which deserves mention. F. J. Price (23 Diamond) was baulked by M. Hartland on a similar machine at the worst bit of the road. He swung to the right through clay ruts six or eight inches deep, on to the grass and back into the road without any apparent effort and continued his way—a skillful piece of riding! Then followed nearly thirty miles of main road riding, through Protitwich and Wor-road riding, through Protitwich and Wor-road riding, through Protitwich and Wor-

cester to Malvern, rendered very upleasant by the incessant rain whi marred what would have been an enjous able run through pretty country made g by the blossom on the fruit trees.

Climbing the Wyche. .

At Malvern we noticed Mr. J. Norton with his arm in a sling, due an attack of neuritis. Performances the old Wyche were better than usu although there were some perhaps texpected failures.

Among the lightweight riders, H. Cutler (23 Verns), G. Kuhn (24 Levi) F. J. Lidstone (24 James), C. H. Hawright (23 New Imperial), and J. Walker (24 Edmund-Jap) were c sistently good.

Outstanding impressions, without ference to notes, include the splen climb of E. A. Colliver (A.B.C.), wasterwards experienced wheel coroubles and retired. Colliver made very fast climb, and had to cut-out y down from the summit. All the Jan machines showed up conspicuous. This make was represented by all types manufactured, 2½ h.p. two-street the splent of the sp

MOTOR (YOUR

Victory Cup Trial .-

driving or ignorance of the hill. With a large number of machines of one make in a trial, it is to be expected that the drivers may not all be of the highest standard, but the Norton and Sunbeam representatives were of pretty consistent quality. The Harley-Davidsons were fast, but G. Grinton, the Scottish rider, seemed to have difficulty in finding his gear when changing near the summit, but the way on his machine and his desterity saved the situation.

G. Nott's Matchless was misfring badly near the summit. W. E. Emery's single-cylinder Rex sidecar climbed the

G. Nott's Matchless was misfring badly near the summit. W. E. Emery's single-cylinder Rex sidecar elimbed the bill very steadily, quite the reverse from the pre-war method of single-cylinder sidecar drivers, who got into low gear early and reared away with the thruttle

fully opened.

In pre-war trials it was usual for trials organisers using the hill to requisition a gang of "navvies" with ropes-to take machines and their riders. Most were good, two or three remarkable, and a few did not impress us at all favourably. Dance on a Sumbeam made fastest time in 25s., but will probably be beaten on formula by the A.B.C.'s, which made wonderful ascents, particularly that of Porter who tied with Howard Davies (6 A.J.S.) for second place, §s. after Dance; Applebee (A.B.C.) took 25gs., and Woodcock (6-7 Ariel) 25gs. These were the fastest solo climbs. Though actual failures on the test were rare, one or two stopped before the summit; this, however, did not entail any loss of marks. The times varied from 25s. to over a minute. Anything under thirty for a solo mount, and under forty for a sidecar, must be considered distinctly good. One large sidecar outfit (American) took 55gs. The acceleration powers of some of the machines were really remarkable; they started smartly and seemed to gather speed all the way.

R. H. Nicholls (B.S.A. sidecar) passing interested spectators on Rising Sun. Note the loose surface of the road.

harge of the machines that failed on the ill, but so greatly improved are presentlay motor cycles that the only ropes in ise were those utilised to keep back the interested public.

From Malvern the competitors were aken across country to Portway and Birdlip.

The Acceleration Test.

Near the foot of the latter hill was a ime check from which the competitors ere sent up as they arrived to the acceleation test which was held on the straight tretch near the top of the hill, finishing amediately below the left turn just allow the summit. Here competitors were opped behind a tape, given the word to by Mr. Phil Mosedale, and their time iken till they passed the white flag, after hich they had to proceed to Chelten-am down Leckhampton Hill. Most of e riders made an excellent start on the eep gradient-better, we contend, than similar batch of cars could do. Many ade a mistake in changing up too soon; ten the speed decreased when this was ten the speed decreased when this was one, and some had to change down ain near the summit. A few riders cut if or the top corner, which was really mecessary, as others took it cleanly on a inside of the bend at a higher speed. ime of the performances here were excelat, and reflected great credit upon the The fastest solo times were as follow:

E. Porter (5. A.B.C.) S. H. R. Diwige (6. A.S.) R. C.) W. Woodcock (6.7 Ariel) J. H. Wasker (4. Triumph J. J. Blake-Marsh (4. Triumph W. Wortall (3)§ Sunbeau M. C. Breeze (44, B.S.A.) A. L. L. Seeley (47, B.S.A.) M. C. Attberley (3½, Norte	 P.)	25556666667775
F. J. Watson (6 Ariel)	vidson) Davidson) am)	 363 363

H. B. Denley (8 Morgan) 52 H. F. S. Morgan (8 Morgan) fast F. W. James (8 Morgan), good start, then steady climb.

W. Brandish and F. A. Applebee missed the turn at the top of Birdlip, and went some way along the road to Cirencester.

On Birdlip we saw the Martinsyde-Newman, which was finished too late to start. The engine was running ex-

The capacious vard in the Plough Hotel and the refilling arrangements by Steel's Garage were commendable, and the usual crowd, never apparently tired of watching the three to four home's procession of competitors, looked on with evident interest. The rearguard of the procession took tea instead of the hunch intended, the time being so late. Entering the hotel yard, G. Nott, the only Matchless rider, bent his footreet and damaged the controls. due to the sidecar wheel lifting, but he continued.

Rising Sun.

Leaving Cheltenham, the course lay along Gambles Lane, rejoining the main road at the top of the famous Rising Sun Hill. As usual, many spectators had gathered to witness the climb, and though the road surface was dry and distinctly better than on the occasion of the Colmore Trial, there were several quite exciting moments, especially when competitors floundered about in the loose stones, or had to get past others who were in difficulties.

The majority of the riders made light of the hill, some roaring up seemingly in a great hurry, others taking it easy on low gears. Quite the fastest ascent was made by S. E. Longmore (8 Harley-Davidson sc.). He fairly "zoomed" up, bouncing in his saddle all the way. J. N. Roberts (3½ Scott), F. A. Applebee (5 A.B.C.). W. B. Gibb (2½ Douglas), and G. Dance (3½ Sunbeam) also made fast climbs. W. Ford (2½ Coulson B) came up well, but fell near the top. Both T. F. Watson (4 Norton sc.) and E. Porter (3 A.B.C.) were baulked by the spectators and slower machines, but managed by magnificent driving to get past without mishap. J. S. Bacon (6 Regent sc.) failed on the corner, and, running backwards, was narrowly missed by T. Stephens (4½ James sc.).

Altogether a dozen competitors failed,

Altogether a dozen competitors failed, all these being low-powered sidecars or lightweights.

There were several quite spectacular performances, which evoked much enthusiasm and comment on the part of the crowd. Gus Kuhn (2½ Levis) roared up with one hand on the bars, showing that familiarity with the hill breeds contempt. L. Paynter (3½ Norton) waved furiously to the crowd, and very nearly fell in consequence. The luckiest competitor at this point was, however, G. W. Walker (3½ Norton). He came up swerving in an alarming manner, and very nearly ran into the spectators in his attempt to recover. Everyone gave him up for lost, but he found himself safe at the top. The two G.P. Morgans climbed very well.

Sudeley Hill.

Performances were so consistently good on this hill that mention of individuals would prove almost monotonous praise. Suddley probably provided less incident than any observed part of the course, and the observers were apparently very bored to have to stay there three hours with so little entertainment. T. F. Watson (Norton sc.) climbed at speed, with H. F. S. Morgan (Morgan) along-side. It seemed that the two machines would collide when the top of the hill

H. H. Saddington (5-6 James sidecar) and R. C. Atcherley (4 Triumph) turning into the "Colonial Section" at the top of Sudeley.

was reached, where the competitors were directed through a gate on the left. Skilful driving, however, saved a collision.

When sixty-odd competitors had climbed the hill without one of their number even showing the least sign of distress, we left a colleague to watch the rest of the 170 riders, and joined in the procession. The next few miles provided more room for thought, as this was the "Colonial" stretch across rough farm tracks over the wolds, a five miles

section providing conditions approximating to those overseas. Very careful driving was necessary on the part of certain sidecar competitors to prevent underslung chassis scraping on the ridges between the ruts, but we did not hear of, nor see any, "casualties" in this section.

Willersey was the last hill, which, although the surface was rough, did not present the difficulties expected by the organisers when they planned the course, and there were few failures—indeed, the

performances generally were almost uniformly good. G. Dance (3½ Sunbeam) was exceedingly fast, in fact his speed was reminiscent of a hill-climb. Again the James entrants showed up conspicuously, and G. Kuhn (24 Levis) displayed his ease by riding one handed. S. Hall, (22 O. K.-Union), S. T. Ashby (2½ Connaught), S. G. Neal (3 Neal-Dalm), M. C. 'Atcherlev (3½ Norton), B. Jessop (4 Triumph), W. B. Gibb (22 Douglas), J. C. Walker (2½ Edmund), F. A. Applebee (3 A.B.C.), and E. Williams (3½ Sunbeam) were among the many who made good climbs. H. Gibson (2½ -Clyno) nearly fell in the stones, but made a fine recovery. O. G. Smart (8 Sunbeam sc.) had no rear guard, and as his back wheel was fitted with Parsons chains if presented quite a weird appearance.

After this hill the route was over mair roads through Stratford, Warwick, and Kenilworth, back to the starting point at the George-in-the-Tree Hotel a Berkswell.

The scene at the finish was a veranimated one, for, in addition to the 250 competitors and passengers, and the multitudinous officials, there were severa hundred spectators to welcome the rider back. Only nine competitors failed the check in at the finish.

It is expected that the results will be available for next week's issue.

INCIDENTALLY -

One competitor, Rev. J. M. Philpott A.C.U. consul and chaplain of the Country and Warwickshire M.C., climbed a hills successfully on a brand-five 23 h.1 Wilkin-Blackburne, which was only handed to the owner on the previous afternoon.

A Martinsyde-Newman was to make it $d\ell but$ in the hands of S. Newman, but i was not ready until 10 a.m. on the do of the trial. As a result Mr. F. ξ Whitworth toured round as a spectato

On the Old Wyche H. F. S. Morgan cuts the corner.

V.ctory Cup Trial .--

but was soon lost in admiration for the acceleration powers of the new twin V agine, which, it will be remembered, has overhead exhaust valves, a reversal of the usual practice with engines having valves over one another.

Our condolences are extended to E. Matthews (Brough), who, after climbing all hills and conforming to the conditions, broke a chain on the very summit of Willersey—the last climb.

For thorough organisation, the Birmingbam Club's methods in Saturday's trial would be bird to beat. We congratulate ill concerned on the clear and concisely written instructions issued to competitors and officials alike.

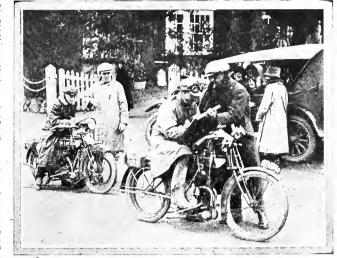

If there is a noted hill in England with a smoother and better surface than Birdlip we should like to hear of it.

The procession of riders lasted three solid hours—rather too long and tiring. We fancy the minute interval starts will be cut down in future.

A prospective T.T. rider, whose chances are greatly fancied, made fastest time in the acceleration test. He was G. Dance, riding a 3½ h.p. Sunbeam, a make of machine on which he has scored many successes since the end of the war. His time of 25s. equals a speed of upproximately 29 m.p.h.

Beaten by one-fifth of a second only in the acceleration test on Birdlip, Howard R. Davies (6 A.J.S.) and E. Porter (3 A.B.C.) tied for second place. The pick-up of these leading machines from a standing start was simply extraordinary.

Large crowds of spectators congregated at Berkswell, Malvern, and Cheltenham

One of the New Neal Dalm two-stroke and a B.S.A. checking in at British Camp

(Rising Sun), proving once again a point we have dilated upon, viz., the increasing popularity of motor cycles since the war, ascribable in no small measure, in our opinion, to the yeoman services rendered by motor cyclists in the great war.

Undoubtedly the trial for the Victory Cup proved that the Cotswold test hills, so formidable to the average pre-war machine and rider, can no longer provide great honours in competitions, and that almost any machine made to-day can climb the Old Wyche at Malvern, Portway, Sudeley, Willersey, and the famous Rising Sun.

In wet weather, of course, these hills present very certain difficulties, and had the roads been in bad condition the performances last Saturday would not have been so consistently good. This indicates that it is conditions, not gradients, that sift out machines and riders.

Competitors awaiting their turns to start in the accelerating test. H. V. Collins (41 B.S.A. sidecar) and O. G. Smart (3 Sunbeam sc.) leading

TAXATION.

Extracts briefly giving the Opinions of our Readers on this Vital Topic.

HE publication of the proposed new taxes on motor cycles has brought us a great many letters from readers, who have, very naturally, been quick to see the gross injustice which it is apparently the intention of the Government to inflict upon motor cyclists, and that without giving a motor cycle representative a place on the Advisory Committee. Major Stenson Cooke, of the Automobile Association, was apparently alone in his protest against the unfairness of the recommendations.

Below we give extracts from some of the many letters we have received on this subject, most of which are by no means unreasonable.

In answer to the question, "Are motor cyclists to be taxed off the road?" Mr. V. F. Bush writes:

The answer to your question is "yes" unless all motorists take a firm stand against the proposed new tax. My opinion is that 75% of the motoring public do not realise what the Government is up to. An increase of from £1 to £4 for a Sidecar machine is out of all proportion, and is nothing less than "barefaced daylight robbery," and—mark these words—the tax will not stop here, but next year will be increased to £6, and so on each year ad infinitum as long as the motorist will pay up and say nothing.

"J.C.," Eccles, is of opinion that motor cyclists could unite, and force the Government to fairer pro-

posals. He writes :

I, myself, can still afford to run a combination, yet there are thousands who would be cut off entirely from the health giving pastime. I think if we absolutely refused to use our machines (including those who could just afford to run) and car owners did the same, it would let the Government see that something fairer we were determined to have. Instead of the Government stimulating motoring (which would bring all the money they require from us), they are going to kill it, and kill trade—what has the manufacturer got to say who is on mass production of powerful combinations?

If things go on as they are for any length of time England will not be a fit place for any honest hardworking Britisher, and the sooner he clears out the better.

The Light Sidecar Outfit.

Mr. A. A. Smith champions the cause of the light sidecar outfit as follows:

Is not the proposed taxation a little unfair to the owners

of lightweight combinations? I think so.

My motor cycle weighs under 200 lb., the proposed tax is 30s., but because I possess a light sidecar I must pay £4 for the combination—in other words, £2 10s. for the sidecar.

Surely a light sidecar should not be taxed as highly as a lightweight motor cycle by a long, long way. Why not

tax the sidecar according to weight?

[It is proposed to tax sidecars £1; therefore, a sidecar attached to a machine under 200 lb. in weight would be taxed £2 10s. altogether .- ED.]

Mr. E. Arnold has a word to say for the working man who can only afford a cheap second-hand outfit, and is in danger of being driven off the road for the simple reason that he cannot afford to pay a heavy tax.

Take the case, he says, of a working man who can only afford a second-hand machine (about £35). He will He will have to give up if the new tax comes into operation, thus losing his week-end run into the country with his wife losing his week-end run into the country with his and children whereas the man who buys a piano is not taxed. Is not the 6d, a gallon on petrol the fairest way of taxing? All I have to say is that I and several of my friends are going to get rid of our machines if the new scale of taxation passes which I hope it will not. I feel sure, there are hundreds like me who can just only manage to keep a motor cycle.

Mr. F. F. Cleghorn writes of the unfairness of expecting motor cyclists who have been debarred from the use of their machines being expected to pay for the damage done to the roads by war traffic during this time. He writes:

I-and I expect there are thousands in a similar position struggling under the present enormous load of taxationjust about manage to carry on my favourite pastime

It seems to me that the unfortunate motorist is always expected to "stand the rub"; in this case, he is expected to foot the bill for depreciation in the roads which he had no hand in causing, because the majority of us have been absolutely debarred from using our machines until quite recently.

Disabled Motor Cyclists.

Mr., J. L. Hodson, who was badly knocked abou in the war, and finds a sidecar outfit his only con venient means of locomotion, naturally objects to an extra £3 tax. He concludes as follows:

My job was lost by joining the Service, and I have som-difficulty nowadays in making ends meet, so that the extr. £3 is not to be taken too lightly. Ex-Service men, such as myself, desire no charity, neithe will we have it, but we would like a little consideration especially when the motor cycle takes the place of leg ruined in the war. No doubt there are many like myself.

Justice," Edinburgh, wants to know why the ta: on a sidecar should be increased four-fold while that or a luxurious Rolls-Royce is only approximately doubled and he suggests an organised protest. He writes:

It is astonishing to find that it is proposed to quad ruple the tax on the unfortunate owner of a motor cycle and sidecar, while that of the war profiteer, who can afford a-luxurious Rolls-Royce, is only approximately doubled Surely this is not a sample of British fairness. expects to pay increased taxes, but why this unjust burder on the particular class which can least afford to bear it? I on the particular class with income under £1,000 feel the pinch of present day circumstance more than any other class, and still the burdens are piled on for they form the bulk of the owners of motor cycles and light cars, the tax on the latter being at least trebled under

the new proposals. Further, the C the Committee were requested to draw up scheme which could yield £7,000,000, but the present proposals are estimated to yield £9,000,000.

I would suggest that a strong organised protest be made by motor cyclists to prevent these taxes being adopted. It might take the form of writing to M.P.2s, or, better still, an organised protest on similar lines to the petrol protest.

In the meantime, the A.A., the A.C.U., and the Manufacturers' Union are far from idle. The A.A. has sent out to everyone of its members a copy of Major Stenson Cooke's "minority" report, and has addressed a forcible pamphlet to all members of the House of Lords and House of Commons. In addition to the minority report, additional facts are adduced showing the inequities of the heavy increase proposed in the Budget statement, and urging the retention of the petrol tax which varies the individual tax in proportion to the use of the road.

If the continued efforts of the various associations, the press, and the motor cyclists should prove of no avail, the least we may expect is that motor cyclists are given the same privileges as car owners in having (a) the option of paying quarterly, and (b) a rebate on old machines.

THE TOURIST TROPHY RACES.

Important Alterations in the Course. Practising from May 31st to June 14th. Flying Kilometre on Douglas Promenade for "The Motor Cycle" Cup-a Feature in the Isle of Man Carnival Week.

BY OUR ISLE OF MAN CORRESPONDENT.

ITH the near approach for the closing of the entries for the fortherming Transit III. for the forthcoming Tourist Trophy races, to be held in the Isle of Man on June 15th and 17th, the Auto w in the sle of Man on June 15th and 17th, the Auto-Cycle Union is now hurrying on with its arrangements, and last week the Rev. E. P. Greenhill (chairman of the Competition Committee) and Mr. Loughborough (the secretary of the A.C.U.) paid a short but busy visit to the Island, during which they interviewed His Excellency the Lieut-Governor, Maj-Gen. Fry, the Government secretary, the Highway Board, representatives of the Douglas Corporation, and other officials.

Practising Dates.

It has now been decided that practising is to start at 4.30 on the morning of May 31st, and will be continued up to the morning of June 14th, week days only. Practising finishes at 7 a.m., and after that hour, and after reaching their respective garages, racing machines, under no circumstances, will be allowed on any road in the Isle of Man. Machines before practising must bear their racing numbers, and riders must comply with the regulations with regard to wait the state of the regard to the racing helmets' and other safeguards.

Practising to be Controlled.

Practising will be controlled, and each competitor before starting his morning's practice must "clock in" at the official timekeeper's box. This is to comply with the regulation making it compulsory for riders to complete a certain number of circuits of the course, one of which must be done at a certain minimum speed, before being allowed to take part in the actual competition.

Alterations in the Course.

For reasons it is not necessary to mention here, but which For reasons it is not necessary to mention here, but which are considered good and sufficient, there is likely to be a slight variation in the famous T.T. course. Motor cyclists who know the Island, and who know the course, will remember that, after passing the bottom of Hillbery (that exceedingly fast last drop coming down the mountain), the course need to bear off to the right at Cronk-ny-Mona, and from there past Edge's Hedge to Johnny Watson's Corner, about lialf a mile from the top of Bray Hill, the old starting and finishing rout. finishing point.

The New Course.

The condition of the road from Cronk-ny-Mona is not good, and, to avoid these nasty corners, the course this year will not bear off to the right at Cronk-ny-Mona, but will go straight on along the road which leads to the top part of straight on along the road which leads to the top part of Onchan village for about 300 yards, when it will bear sharply to the right and pass down the road called the "Old Glencutchery Road." This road runs past the back of Government House, and joins the Governor's Bridge with an acute right-hand hairpin corner, which will probably be the most difficult corner on the course; so difficult, in fact, that no rider will be able to take it fast

After passing over Governor's Bridge, riders will travel along the Glencrutchery Road to the top of Bray Hill. This is a fine broad road in good order, along which riders will travel at speed, and will proceed down the Bray Hill as before. This alteration will make. Bray Hill probably the fastest part of the courses.

It has also been decided that the start will be along the Glencrutchery Road, facing the Playing Fields, which the Douglas Corporation have placed at the disposal of the

A Motor Cycle representative recently travelled over the course, which was found in fairly good order, with the exception of the four-mile run from Sulby to Ramsey,

A Bad Stretch.

This part of the course is very bad, so much so that the A.C.U. officials last week informed the Highway Board, who are responsible for the repairs of the Manx roads, that, unless steps were immediately taken to effect the necessary repairs, the race would be cancelled.

To be Repaired Forthwith.

A special meeting of the Highway Board was summoned on Wednesday, April 21st, and the Board instructed its surveyor to stop all other road repairs, and to concentrate surveyor to stop all other road repairs, and to concentrate on this part of the road, and assurances were given to the A.C.U. officials that it would be repaired in ample time for the practices. His Excellency the Lieut-Govennor, Maj. Gen. Fry, has kindly consented to present the prizes after the Junior and the Senior events on Tuesday and Thursday evenings respectively, at the Palace Ballroom.

It is now fairly generally known that T.T. Week in Douglas this year is to be a great Carnival Week. All sorts of sports have been arranged, and, amongst other items, there is to be a race for motor cycles along the Douglas Promenade, similar to that field in 1913. The distance of this race will be one kilometre, and the race will televables exit below. will take place on the cement footpath. This race is being organised by the Manx Motor Cycling Club under a permit from the A.G.U., who will supply the chief marshal and the timekeepers. There are to be three classes: 500 c.c., 350 c.c., and 275 c.c.

The Prizes.

The cup for the fastest time has been presented by The Motor Cycle, and numerous other firms have offered prizes. Anybody can compete who is on the competition register of the Auto Cycle Union, which is rendering great assistance to the promoters in every way to make this event a 'real success.

The Organisers.

Further particulars can be obtained from the hon. secretary of the Manx Motor Cycle Club, Hill Street, Douglas. The entry fee is one guinea. Machines may be stripped, the only restriction being that they must possess two efficient brakes.

On the Friday afternoon, there is also to be a motor gymkhana, details of which have not yet been settled.

Headquarters.

Headquarters. The A.C.U. headquarters for the I.T. races have been fixed at the Castle Mona Hotel, whilst the A.C.U. office is in Athol Street, opposite the *Times* Buildings, the premises being placed at the disposal of the A.C.U. by the proprietors of that journal.

Early Arrivals.

Several riders have recently been practising on the T.T. course, including Sunbeams and Indians. Quite a large number of firms have already booked their rooms. The well-known Clincher Tyre Company propose erecting a coffee stall at the official start at the Playing Fields. It coffee stall at the official start at the Playing Fields. It will be open every morning during the practices, which will start every morning at the new starting-place. The A.C.U. anticipate a very good entry, notwithstanding the fact that several of the older firms are unable to compete.

Closing Date for Entries.

It may be well to remind intending competitors that entries at ordinary fees (£21) close at noon on Monday, May 3rd, after which date until May 17th double fees will be necessary.

CLUB NEWS.

Rochester, Chatham and District M.C.

The first picnic tea rnn will take place on May 2nd to Box Hill.

Bridgwater and District M.C. and L.C.C.

It is proposed to hold a reliability trial in the future, to compete for the challenge cup which Mr. Carver has kindly presented to the club. The hon. secretary is Mr. J. W. Hooper, The Oaks, Wembdon, Bridgwater.

Newcastle and District M.C.

A flexibility test will be held under the auspices of the Newcastle and District Club on May 2nd. The members will meet at Moor Honse (six miles north of Weldon Bridge), on the Wooler Road, at twelve o'clock prompt. There will be seven classes, calculated on cubic capacity, and a gold medal will be the reward for the winner of each class.

North London M.C.C.

An enjoyable run was made to Harlow, and Bishop's Stortford on the 18th inst. Two watersplashes were encountered, and caused considerable amusement, while a Morgan demonstrated the quality of its inner tubes by allowing one to "balloon" in a. most disconcerting manner. The club will hold a paperchase on May 1st.

Luton and Bedford A.C.

A very sporting hill-climb was held by the club on the 24th. The hill was kept secret, all competitors being piloted to the starting point by officials, having been weighed in at Luton. The sharp left-hand bend accounted for several competitors, who tried to get round too fast and fell in consequence. The results, worked on The Motor Cycle formula, were as follow: 350 c.c. Class: F. F. Briggs (24 New Hudson). 600 c.c. Class: F. F. Briggs (24 New Hudson). Unilmited Solo Class: H. Reyne (3 A.B.C.). Unlimited Sidecar Class: Capt. Cooke (5-6 James sc.).

The Bedford and Dist. M.C.C. and A.C.
There will be an extraordinary general

There will be an extraordinary general meeting at the headquarters, the Rose Hotel, High Street, Bedford, on Saturday, May Ist, at 8.30 p.m.

TRADING WITH FORMER ENEMY COUNTRIES.

The following resolution has been passed by the Council of the British Association of Trade and Technical Journals, Limited:

"In view of the expression of opinion by Sir Auckland Geddes, as President of the Board of Trade, regarding the acceptance of advertisements of goods manufactured in late enemy countries. the Council have carefully considered the whole position. They now recomend members to adhere to the adopted policy of the Association not to accept such advertisements for the present, in order to enable British manufacturers to recover their normal working conditions, At the end of the present year (1920) the subject will again be considered, with a view to further advising members on the subject."

The publishers of "The Motor Cycle" readily accept this recommendation, and have, in fact, constantly refused offers of advertisements of German goods.

Hull M.C.C.

The following awards were made in connection with the first competition, which was held on the 24th inst: Gold medal, L. Runton (44 B.S.A. sc.). Silver medal, R. Fearnley (5½ Rudge Multi). Bronze medals, G. Thompson (4 Triumph), H. Scarlett (5½ Rudge Multi), and G. Goodall (6 to 8 New Imperial).

Wakefield and District M.C.C.

On May 2nd a reliability trial will be beld by the above club, starting from the White Horse Hotel, Wakefield, at 10 a.m. The route will be about 120 miles in length.

N.M.C.F.U. (Portsmouth).

On May 2nd a run will be made to Beaulieu Abbey, starting from the "Coach and Horses?" at 10 a.m. The rente includes Farcham, Wickham, West End, Burgess Road, Redbridge, and Totton.

Loughborough and District M.C.C.

A branch of this club has been former at Coalville, with Mr. S. Clarke, 122 Ashby Road, Hugglescote, as hon. sec A very interesting lecture on "Moto Cycle Ignition" was given, at the annua meeting, by Mr. G. C. Gelling.

Horsham and District M.C. and C.C.C .-

Competitions and social runs have already started, and the club is in a good financial position. There is a steady increase in membership, and any loca motor cyclists who wish to join are in vited to communicate with either Mr S. F. Lampard, 21, North Street, or Mr A. Brice, 43, East Street, Horsham.

Surbiton and District M.C.C.

Fifty-four competitors assembled at the Angel Hotel, Thames Ditton, to compete for the Dale Cup on the 24th inst. The course lay via Esher, Cobham, Fetcham Leatherhead, Hook, and Surbiton, an lad to be traversed twice, and then third time in the reverse direction, making a total distance of 55 miles. Watcheand speedometers were barred, and competitors had to make a non-stop run a 20 m.p.h. The following awards wermade: Dale Cup and gold medal: H. F. Udhe (23 Douglas). Silver fixedals: W. J. Kelly (8 Zenith). F. R. S. Spiking (7) Harley), C. K. Roberts (34 Lea-Francis)

N.M.C.F.U. (Rotherham).

In future all club meetings will be held in the Y.M.C.A., Howard Street. The next is fixed for the Z0th inst.

Southampton and District M.C.

It is proposed to restart the abovenamed club as a purely motor cycle club, and all local motor cyclists are invited to join. Communications should be sent to Mr. E. C. Prince, Kenilworth, 90, Gordon Avenue, Southampton, who was one of the original members before the war, and many times captain and competition secretary.

Bromsgrove M.C.C.

A sporting run to Clent will be held on May 2nd. Members will meet at the Swan, Upton Warren, at 2,30 p.m.

Leicester and District M.C.C.

Good progress is now being made by the club, and several runs have been arranged to take place in the near future. A reliability trial for the Petty cup will he held on May 2nd, starting from Newton Linford at 3 p.m. Hon. sec., Mr. R. A. Spittal, 30, Princess Road, Leicester.

Farnworth and District M.C.C.

At a meeting of motor cyclists in the above district, held on April 15th, it was decided to inaugurate the abovenamed club, and any information regarding it may be had from the secretary, Mr D. B. Williamson, 189, Albert Road, Farnworth, near Bolton.

Warrington M.C.

A large crowd of interested spectators assembled on Keckwick Hill to witness the hill-climb recently held by the above club. Altogether there were seventy entries in the various classes, and the event was a great success.

The performances of the brothers J. and B. Caldwell attracted particular attention. In the "Any Capacity."
Class they twice tied for the fastest time

Class they twice tied for the fastest time of the day, their time being 24/s.

The results were as follow: Class 1 (350 c.c.), A. C. Wallington (22 A.J.S.). Class 2 (500 c.c.), A. C. Wallington (23 A.J.S.). Class 3 (600 c.c.), S. K. Hodgson (4 Triumph). Class 4 (750 c.c.), B. Caldwell (23 A.J.S.). Class 5 (any capacity), J. Caldwell (3½ Norton) and B. Caldwell (23 A.J.S.). Class 6 (750 c.c., sidecars), A. J. Bailey, (4 Norton). Class 7 (sidecars, any capacity), J. Massey (6 7 (sidecars, any capacity), J. Massey 16 Royal Ruby). Class 8 (light cars), S.

The course included difficult country in Yorkshire and Derbyshire.

BORROWING IDEAS FROM THE CAR.

A New Machine with V Engine placed across the Frame, Shaft Drive, and a Driving Wheel supported on One Side only.

SEVERAL years ago a T.A.C. motor cycle was produced which had shaft drive and a V twin engine placed across the frame. The V engine was later displaced by a four-cylinder unit. This disposition of the engine, with the exception of the A.B.C., has not received the attention which its possibilities seem to warrant, although of late Continental designers have given consideration to this type of machine, one example of which—the Brevete Spring—was illustrated in The Motor Cycle for February 19th this year.

A Two-track Three-wheeler.

Mr. W. A. Wood, A.M.I.E.E., of Leytonstone, is the latest designer to consider the advantages of a transversely disposed V twin engine in conjunction with other ideas of more than usual interest. The construction of the framework is such that the cycle element may be said to end at the seat-pillar, from which point the vehicle (one can scarcely term it a "combination") departs from conventional practice. There is more sidecar chassis than motor cycle frame in the make-up of the complete machine, and cycle car principles are not entirely absent. In fact, the influence of all types of light passenger vehicles appears to be present, and it is interesting to dissect the design to see where one ends and the other commences. If we do this we may classify the parts as under:

Motor Cycle.
Front forks and steering.
Sidecar.

The construction of the framework which supports the passenger accommodation.

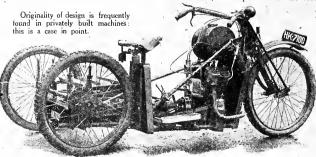

The rear axle and springing.

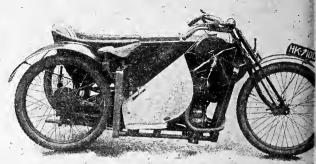

Engine position, gear box, and shaft drive.

NEW IDEAS.

The methods adopted to connect up the various units.

The designer himself evidently appreciates the hybrid nature of his vehicle, since he has christened it "Carnation," the name being derived from the words car and combination.

The extra broad mudguarding, giving big clearance, and metal cover for the transversely seeing engine, are details worthy of note.

Starting from the fore end, a pressed steel member forms the steering head, to which is connected another pressed steel unit, which takes the place of tubular members to form a duplex frame. From the foot of this section there are two

pillar structure, but the other is contirrearwards, and is supported with adpanion tube by a transverse struct which is also of pressed steel construct. This latter is suspended by coil spron the tubular axle supporting the wheels.

forms an approximate triangle.

The engine unit is a 6 h.p. J.A
which is placed off the centre line of
"cycle," in order to permit a strai
through drive to the bevel gearing alo
side the driving wheel. A handle
control clutch, two-speed gear box, an
shock absorber form part of the dry
mechanism.

It will be noticed that both rear when may be detached with the same convence as in a car, while the mudguard too, follows car lines. Altogether-design which is covered by patents, interesting, and although at first-as one may be constrained to regard it as over-development of the sidecar, a consideration it is quite conceivable to a "sidecar" machine of this type to probably be produced more cheaply the more conventional combinations motor cycle and sidecar attachme Further, it permits of a position for a twin which experts consider his drive without having to transmit drive through a pair of gears began that the subal in car practice.

Further developments of the design we he watched with interest. And amon these developments we expect to fi that the engine is set so that the validace forward instead of backward, si one of the main advantages of the traverse engine position is lost by.

present arrangement. If this afterst is carried out it may prove necessary enclose the valve mechanism.

Showing the bevel casing on the side of the driving wheel and the rear suspension.

parallel tubes running longitudinally to a similar pressed steel structure which serves, among other duties, to supplant the seat-pillar. One of the longitudinal tubes referred to stops short at the seat-

Motor Cycle Legislation.

HE more one examines the various reports pertaining to the proposed legislation concerning motor vehicles, the more one realises how unfairly motor cyclists have been treated. We refer first to the fact we have often mentioned that motor cyclists were not directly represented on the Departmental Committee on Taxation appointed by the Ministry of Transport. It will be recalled that, although the figures given in the report show that motor cyclists considerably outnumber all other sections of the motoring public, they were ignored when the Committee was formed.

Private car owners had two votes, commercial vehicle users one, manufacturers one, and omnibus owners one. True, both the A.C.U. and the Motor Cycle Manufacturers' Union were ably represented on the Motor Legislation Committee, which acted in an advisory capacity, and by some this may be considered sufficient. We will show

that such was not the case. Failing, for the time being, to get favourable consideration of a tax on fuel, the motor cyclists' representatives suggested the schedules which were discussed last week, and in which it was proposed that sidecars be taxed \pounds_1 , which would mean that a lightweight machine taxed \pounds_1 ros. and fitted with a sidecar would be subject to a total tax of \pounds_2 ros. In the hands of the Parliamentary Committee, however, this was changed so that owners of all sidecar outfits are

required to pay £4.

Probably the motoring element on the Committee, as distinct from the Government representatives (who incidentally outnumbered them) not being motor cyclists, allowed the matter to go through without vigorous opposition. This is one result of the Government's injustice to motor cyclists in not giving them a representative on the Committee.

The second injustice is a repetition of the first. Motor cyclists were not represented on the Ministry of Transport Departmental Com-

mittee on Lights on Vehicles, with the result that motor cycling interests are again overlooked. The constitution of this Committee included representatives of the R.A.C., Commercial Motor Users, A.A. and M.U., Society of Motor Manufacturers and Traders, Cyclists' Touring Club, and the London and Provincial Omnibus Owners' Association. The A.C.U. and the Motor Cycle Manufacturers' Union were again ignored. Could anything be more unfair to the motor cycling public?

Suggested Lighting Regulations.

It is suggested in the report that (1) motor cars shall not be permitted to use more than two head lights; (2) the diameter of the clear glass aperture shall not exceed 7in.; and (3) electric lamps shall not be more than 24 c.p. each, or, in the case of gas lamps, the burners shall not consume more than 21 litres per hour.

In the case of motor cycles, the diameter of the clear glass aperture of *head lamp* must not exceed 5in.; electric bulbs must not exceed 12 c.p.; burners 14 litres per hour.

It is perhaps obvious that not one of the Parliamentary Committee can satisfactorily explain why a motor cycle should not be permitted to have more than one-quarter the light regarded as necessary for a car.

The many anomalies possible with the proposed taxation and lighting, together with the present definitions of motor car and motor cycle, would be extremely humorous if the matter were not so serious. If nothing is done to amend present and proposed legislation, we may see the owner of a 2 or 3 cwt. four-wheeled motor cycle compensated for his £10 tax by having the privilege of using two 7in. 24 c.p. head lamps.

All motor cycle matters appertaining to legislation require amending, and motor cyclists should demand that purely motor cycle organisations are allowed to be directly represented on the Committee appointed to amend them.

Speed Wobble.

THE correspondence on this controversy which I initiated so long ago drags on without any very authoritative utterances. The extreme example which prompted my own diatribe has been fully cleared up, and was of duplex origin. For one thing the frame was out of truth. For another thing the ball races in the steering head were faulty. The consequence was that the machine could not run straight, and that the friction in the head exaggerated my instinctive corrections, and accentuated the serpentine path. When the frame was trued up and new ball races had been fitted, the machine was a joy to ride. some technical expert conducts a special research into the question, my own impression will be that the average motor cycle can be steered quite decently at all the speeds of which it is capable. But that if such machine takes a bad toss, or if the owner neglects his steering head bearings, or both, the machine will become more or less dangerous at speed. I am at present trying to secure a bad wobble from a new machine carefully handled on a perfect surface, and so far I have met no success whatever.

Dry and Clean.

ECENTLY I had an engagement to a very swagger function—consider swagger function—considering my humble rank in the community. The venue was five miles off, and the day was wet, with roads swimming in liquid filth. It was necessary to arrive (1) clean, for social reasons, and (2) dry, for hygienic reasons. as the function would occupy some seven hours. So far as cleanliness went, I could trust my Scott : its footboards and front splashers divert the entire mud bombardment. But the rain would plainly soak my legs from the knees downwards, even if I wore a long rainproof coat. So I was compelled to wear leggings in order to keep dry. Now a careful man (such as I am not) may cleanse the outside of his leggings after each run; but it would baffle Beau Brummel to emerge from a well-used pair of legging overalls with tidy trousers, because the leggings pass over the boots every time they are worn, and the boot soils the inside of the leggings, which are so made that they cannot be rolled inside out and brushed. So I wore a long coat and leggings: arrived at a garage near my destination, pulled off the leggings, thereby soiling my trousers from top to bottom: brushed my trou-trous: washed my hands: and walked the last mile. I shall not do it again. I have now ordered a pair of spring side gaiters, which will, on any future occasion, protect that part of the trousers which projects beneath the long coat. Even then I suppose the aforesaid springsided gaiters will crumple the base of my trousers, and destroy the two neat vertical creases which my valet (no swank-Mrs. Ixion is indicated) will have

been at such pains to create. I think I must fit Scott with a rainscreen. Not a vertical affair, such was recently pictured in our columns, but a horizon knee screen, projecting backwards from the steer head, with an ample V where my waist would cor Then I fancy the long coat might unaided meet Nobody has yet marketed a rainshield. this particular purpose; but it should be easy to dev one which would not look unsightly, and would far towards keeping our nether limbs dry.

Starting a Warm Engine.

URING recent weeks I have had a few requ for aid from readers who experience trouble starting a warm engine. It is never safe generalise about starting tips, for the idiosyncrasies engines are most pronounced in this respect, and w suits a four-stroke may give a two-stroke a bad tun ache. Several years have elapsed since I owned ergine which was amenable when cold, and sulky w hot. But at one stage in the motor cycle era nuisance was not uncommon, and was always due very weak compression. When an engine is hot, magneto can easily be run fast, the valves can ha stick, and the engine temperature must help the pe to vaporise. The usual snag in such cases was a worn valves and piston rings created compression le ages, except when a film of cold oil sealed the cl ances to some extent. When the oil had been thin down by heat, it became difficult to get a depres in the spraying chamber, and the obvious tip wa: put a hand over the carburetter air intake, and so centrate the suction upon the jet. In these days, h ever, valves and rings maintain their fit very well

Carburetter Gauzes.

SEE one of the "out patients" under treats in our technical query department was not q clear in his mind as to whether the carbure gauze mattered or not. It may interest him to-k that two of the most horrible night rides I have had owed their misery to carburetter gauzes. In first incident, which occurred many years ago, I out to ride from London to Durham by night in bad weather, and I had barely cleared the subus before the machine commenced to misbehave. I not so well versed in the caprices of motor cycle so I am now, and as no inspection light was availab the night was half gone before I spotted that carburetter air intake was half sealed by a blotol mud thrown up by some passing wheel. That of course, is an extreme instance. But one night dul this last winter I was a very puzzled man for ten nes or so. Having to start up a half-frozen enginin the dark, I unscrewed the gauze screen from the buretter air intake, and pushed in a rag soakeding tional Comments .--

ol. After starting the engine I screwed back the without noticing that the gauze had dropped out t. The machine started well and ran regularly igh, but had dropped about 50% of its power. simple fact is that some of the caps, whether ze or baffles, now fitted to air intakes, throttle the to the extent of 50% or so, and if they are removed, entire adjustment is ruined. In some cases, r.g., B. and B. two-stroke model, a variety of air caps provided, and utilised in tuning up the setting.

Tipping.

I ipping.

VITH all deference to "Yorkshireman," I fancy there may be something in "I fancy there may be something in the explanation which "B." propounds as to the unpopularity motor cyclists as a class at hotels of the more ensive variety. I say nothing about the morality the tipping system, the only respect in which a ion of the "workers" now fail to display indedence. But I think it is a fact that many motor lists do not tip at all, and that others-to coin a de-"undertip." The standard tip in the "hupper des" of Thackeray's "Jeames" is 10% of the Many motor cyclists consider that threepence reasonable tip for the head waiter when settling a lunch, or sixpence when defraying the cost of ner, bed, and breakfast. I defend neither the ter nor the tipper, but merely state what I have erved: the faces of several waiters, noticed from adjoining table, live in my memory. On the top this we bring a good deal of dirt into the hotel, when we get excited, e.g., towards the end of a Days Trial, we are apt to be noisy. Once more, itly or wrongly, the kind of people on whom firsts hotels principally depend for their existence ard us as vulgar, and the staff are always afraid are an offence to their regular clientèle.

If fate had condemned me to be a waiter I should join a union, demand a living wage, and welcome the "no gratuity" system in preference to haunting departing guests with an itching palm camouflaged under a napkin. Human independence being what it is, I presume that the knights of the salver make such an uncommon good thing out of their tips that they prefer to conceal their intrinsic manhood under a guise of servility.

An Appeal to the M.T.A.

AM told that the M.T:A, is unselfishly preventing eager agents from profiteering in new machines. All honour to it, for a thing is worth what it will fetch, and an agent's business in war time cannot have proved very fat. But one trick of the trade has landed several enthusiasts in asylums. Picture to yourself, gentle reader, an enthusiast of the first water taking the road on his 1914 Dudbus, saddened by the umpteenth letter from the factory reporting that, owing to the moulders' strike, delivery of his 1920 Whirlwind cannot be expected till August. Outside a country agent's he sees squatting on the pavement a brand new A.B.C. or Morgan, or whatever line of goods grips his special interest. It is obviously just down from the factory, for its numberplates are plain black, like my Sunday hat. He flings the Dudbus into the gutter, and nose-dives into the showroom, tugging at his cheque book. "Sold, sir!" Death from heart failure would not be unnatural under such circumstances. I think the M.T.A. should prohibit the exhibition of any 1920 machine without a huge red placard "Sold" or "Unsold." Moi, qui vous parle, had almost fouled my last page in The Motor Cycle, for it was the day after my 1920 A.B.C. arrived, and not the day before, that I saw a sister machine with blank number-plates outside the local garage.

A STRING OF SOLO ENTHUSIASTS NEAR BRITISH CAMP, MALVERN.

he recent Victory Trial course lay through this picturesque country, but it was by way of the Old Wyche that the 165 competitors came into the district. This hill of 1 in 5-steeper for a few yards at the top-was, however, climbed easily by the majority.

Road Tests of New Models

The 23 h.p. Blackburne-engined Verus tested by our Scottish Correspondent.

SALIENT FEATURES OF THE VERUS.

ENGINE: 24 h.p. Blackburne, 71 × 88 mm., 350 c.c. LUBRICATION: Mechanical pump pressure feed. GEAR: Burman two-speed countershaft. TANK CAPACITY: 13 gallons.
TRANSMISSION: Chain and belt.
WEIGHT: 200 b. PRICE: £99 15s.

THE little machine was supplied to me by Mr.
Harry Macrae, of Edinburgh, whose name has
so long figured in the Scottish competition
world. It was a stock machine, whose manufacturers had no idea that it was ultimately to
fall into the hands of the press. It was purchased
in midwinter, its general layour rather taking my

eye as a handy mount for the exceedingly trying conditions that prevail in the North. The merits of the Blackburne engine were, of course, well known, and well in accordance with the hard "slogging " requirements of winter, while other points that took my fancy were businesslike riding position, the large tank - one needs it in Scotland -and the delightfully light hand clutch control.

The usual garb for the last month or so has been waders, but in spite of rain the Verus has been put through some strenuous tests

Riding the machine home on that first jaunt fro Edinburgh, a matter of twenty-six miles, I very so learnt that the engine was exceedingly "new." charge of oil was given about every three miles, y the piston insisted on drying up every time the thrott was opened. This state of affairs continued for about 550 miles, while up to the 200 mile mark a long bility.

or a freak always resulted drying up.

The fault, ho ever, was a goo one, and the caref handling exercise during this ear stage of the p ceedings has prove worth while. Who the engine thoroughly run i piston and cylind were carefull gauged, but no si of distortion cou be found-owing, course, to the exce lent design of cyli der head. Unfo tunately, it is rat

d Tests of New Models .-

a single-cylinder to retain its truth in this wayfact, I can only recall one other instance in which light divergence from the truth was not perceptible

er the first 500 miles.

Since then my experience with the little Blackburne one has proved all that might be desired. Even on sty mornings it starts on top gear with a tick over subdued that one can walk alongside the machine. traffic it is delightful, and, combined with the excelt hand clutch, one can thread in and out of the st difficult corners without a suggestion of labouring

The virtues of the unit, however, are not limited to w running and easy starting, as it possesses a most prising "kick" for so small a machine, and will p on kicking even though one imagines it to be at

last gasp. In this pect, its persistency quite amusing, but nappily the machine oo low geared to make of its power on the el. The top gear is to 1 (bottom gear out 11 to 1), which, course, is too low. th a 5 to 1 top, or m higher, the little ount would hold its n against a good many avier machines.

On the way to Edinrgh, which journey I ke regularly, I have measured stretch of renteen and a half les, very "give and ce," with one small wn cn route. Riding · Verus at its natural ed, this distance is vered at the rate of

[There is a legal limit of 20 m.p.h.-ED.]-which not bad considering the gear. On a 31/2 h.p., ared 51/4 to r, I accomplish the journey at a speed

ly 20% better.

It will be seen, therefore, that the Blackburne engine by no means a sluggard, and up to about 33 m.p.h. balance is excellent. Above that speed the large pacity tank begins to rumble, or at least it did till cured the nuisance by packing it with stiff bits of ther above and below. Petrol consumption, so far, s worked out at 104 m.p.g.

Gear Box and Transmission.

As already noted, the handle-bar clutch is one of e lightest with which I have had to deal, the merest essure of one finger being all that is necessary to gulate the drive. The design of the gear box and itch seems excellent in every respect, the external itch adjustment being very simple, while the ck starter is a good solid affair on approved lines. deed the Verus with its docile, hard pulling engine id light handle-bar clutch, would seem to me a ount eminently suited to the requirements of the ir sex.

There is a point I would criticise adversely. The mudguarding on the Verus is no better than it should be, but, alas, this is equally true of practically every lightweight I have tried. In my case this defect rather off-set the various advantages with which I have dealt, for it is of little use possessing an efficient engine and an excellent clutch when the rear mudguard is so designed as to concentrate a stream of mud and water on to the belt, so that the drive becomes inoperative when most necessary.

Wider Mudguards Wanted.

It is really difficult to understand why a detail error of this sort, so totally unnecessary, occurs in these days of enlightenment. The Verus company has turned out a thoroughly practical little 'bus, and it is a pity that a "ha'porth of tar" should be lacking in the

eleventh hour. I also 1150 another machine through the winter, and belt slip seldom, if ever, occurs under the vilest of conditions, so that it is useless to pretend that the defect is inseparable from the system. would, in all good spirit, recommend the Verus people to employ wider and more efficient mudguards both fore and aft, as this would bring about a most desirable improvement in their otherwise highly desirable little machine.

The brakes, etc., are good; in fact, there is no other point than the mndguarding I could criticise, unless it be the silencing. With a Brook-

lands Norton, or anything of that stamp, one does not mind a hefty bark, but on a lightweight, which, at the outset, has other duties in life rather than speed, a free exhaust is out

In conclusion, I may mention that the Verus came through the Glasgow club's Palmer Cup Trophy with a clean sheet with the writer in the saddle, and that in the Edinburgh Club's opening trial recently, when it was ridden by Claude Duncan, it carried off a special award. This is really a fine performance for a 234 h.p. machine fitted only with a twospeed gear. H. MORTIMER BATTEN.

The Verus is a decidedly attractive mount, the outside flywheel of the Blackburne engine contributing to its steady running.

ARE NEW MACHINES WELL FINISHED?

Complaints concerning the detail finish of new machines occasionally reach us. In these days the high cost of motor cycles should at least warrant only the best in material and workmanship. Are we to conclude that the mechanics who assemble presentday models are not living up to the old-time British reputation for thoroughness in detail?

A Miniature Magneto for Twins.

Unconventional Magneto Design, embodying Several Mechanical Innovations.

THE Runbaken magneto has taken a front rank position among ignition apparatus, and is now to be found on a large number of lightweight engines, upon which it is giving general satisfaction. About six months ago (July 3rd, 1919) we fully described this instrument, which has several features of a novel nature

We are now able to give particulars of the new twin-cylinder model, which embodies several features of more than

ordinary interest.

As will be seen from the illustration, the magneto is extremely small, and, like the single-cylinder model, the high-tension terminals are on the extreme end of the instrument, on the side opposite to the driving sprocket. At first sight, the make and break apparatus is conspicuous by its absence. A closer examination, however, reveals that this important device is behind the terminals, and is of the face cam type. This is and is of the face cam type. Inis is partially exposed by removing the end plate, which is held in position by a diagonally disposed bolt and a knurled nut. Adjustment of the platinum points is extremely simple, as there is plenty of room for the adjusting spanner. Instead of using the conventional slip ring, the carbon collector brush beds up against a brass plug, connected, of course, to the secondary winding and lying inside an insulated extension of the armature

The face cam is formed of nonmagnetic steel, and the ball races carrying

the armature are insulated from their housing, which is unusual. We understand this is due to experiments proving that the current returning through greasy bearings has an electrolytic effect, which causes unnecessary wear.

Timing Facilities.

Constructed as a unit with the carcase and the driving end plate are the pole shoes, the armature being withdrawable from the opposite end. This latter unit, in addition to the windings, comprises a condenser, spark gap, earth brush, contact breaker, and high-tension collector. A feature of this model is the variable spark timing, operated by a lever, which passes through a slot at the side of the carcase, and is clearly shown in the photograph, which also illustrates innovation where motor cycle magnet are concerned, i.e., a device in the for of a plunger by which the armature me be fixed at its "maximum position This is a point which will be appreciated." by those who effect their own adjustment

The weight of the new Runbaken tw magneto is $3\frac{1}{4}$ lb., and its external dime sions are $4\frac{1}{2}$ in. long \times $2\frac{3}{4}$ in. wide \times $4\frac{1}{4}$ i high. The works of Messrs. Runbak Magneto Co., Ltd., are at Cheetwo Lane, Derby Street, Manchester.

A Test of Puncture-proof Tubes.

An Inner Tube that is Claimed to eliminate Tyre Troubles.

NE of the latest devices rendering an inner tube puncture-proof has been brought out by Puncture Proofed Tubes, Ltd., Avenue Chambers, Vernon Place, Southampton Row, London, W.C.1. In the history of motoring there have been numerous attempts to render an inner tube incapable of being punctured. While some of these have been effective when new, trouble has often resulted,

On two occasions the motor cycle was driven over a board through which French nails protruded. At the moment the photograph was taken, four nails had penetrated right through the cover into the tube

due to chemical action in the case of the tyre, which has rendered the device unsatisfactory.

The invention under consideration consists of rubber and other constituents, and it is not used in existing tubes, but in those which are specially prepared and manufactured for the company. When cold, both sides of the tube stick together, and before being inserted the tube is placed in water just under boiling point for the space of ten minutes, when it can be fitted just, like any ordinary inner tube. Part of the material is inner tube. somewhat thinner than the rest, and the rotation of the wheel causes this to circulate round the interior, and in the event of a puncture the tiny hole is immediately sealed up, and no air escapes.

Twenty-eight Punctures

For the purpose of illustration, a nailstudded board was pressed on to the tube, and it was found when in this position that four nails actually penetrated right through. No leakage of air was perceptible on any occasion, and when the test was complete no fewer than twentyeight holes were found in the cover. After the tube had been adequately tested by means of the board, five French nails were driven through tiny flint cuts in the cover, right through the canvas, and well into the tube, and a very drastic test

was then applied, namely, the driving a penkuife up to the hilt right throu the outer cover. When this was wil drawn there was no leakage of air pe-ceptible, but the material exuded for space of time, the exudation becoming to and less until the material coagulated. the material is removed by means of h water from the tube, there is nothing prevent a patch being placed over t water from the tube, there is nothing prevent a patch being placed over tout, while vulcanising is also possible.

We hope to report an extended to

Gross maltreatment of an inner tube. Five nails have been driven by means of a hammer through tiny flint cuts in the outer cover into the tube, while a penknife has been inserted in the centre. No leakage of air was perceptible.

A CHANCE FOR THE T.T. ASPIRANT.

REAL "CORKSCREW" ON PART OF THE NEW T.T. COURSE. is corner, or, one might say, "set of corners," will have to be taken carefully. The road comes down over the Governor's Bridge.

EVER has there been such a favourable opportunity for the private owner in a T.T. race. Several of the larger manufacturers have decided not to compete, and in consequence a large number of expert, amongst whom were many likely winners, are riding. This

riding. not mean that ace will be any nteresting, but ear the results t be foretold, the expert e owner, with a le and exceply fast machine, I have a better s of winning in any previous or any subseevent in which cream of the riders will be ting. In the event private may easily minate.

tough the enat ordinary fees last Monday, hink that the exittions Comtof the A.C.U. waive their sative to ask a brivate deciding to the A.C.U.'s ity to state but we think ot unreasonable expect sympa-

consideration

of any late entries from such riders. A private aspirant for T.T. honours or a club nominating a member would be well advised to approach the A.C.U. before concluding that entries at ordinary lees are closed.

Undoubtedly it will be a very sporting race

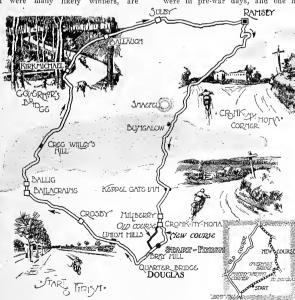

this year, and while the entries will not be of the somewhat unwieldly number of the events of 1913 and 1914, they will be representative of the sport, if not of the entire industry. Motor cycles are faster now than they were in pre-war days, and one may say that speeds are

say that speeds are greater than the speed maximum of the course. Therefore it becomes purely a race of skill, reliability, and endurance. By this is meant that the owner of an 80 m.p.h. machine has little better chance to win than the man who rides one which is ten miles slower.

Everything connected with the organisation of the race is going on satisfactorily, but the work of the A.C.U. does not end here.

Special garage facilities are being arranged with Messrs.
J. Blake and Co., 110, Bold Street. Liverpool, whereby A.C.U. members can leave their motor cycles and collect them on returning from the Island.

The Customs authorities have been approached, and the trouble of getting machines to and from the Island will be minimised.

COMFORT OR APPEARANCE.

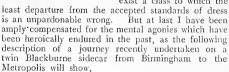

A Rambling Dissertation upon Clothing suitable for Motor Cycling in all Weathers, together with a Description of a Decidedly Wet Journey.

S an all-the-year-round motor cyclist, who, from necessity rather than choice, often undertakes long-distance rides in all weathers, I feel perfectly justified in endeavouring adequately to protect my humble self from the vagaries of our notoriously fickle climate. Arrayed, however, in the multitudinous collection of coats, waterproofs, and waders, which are necessary for warmth and comfort, I am compelled

to admit that my tout ensemble is forbidding and even calculated to strike the nonmotoring section of public and small children with something akin to terror.

Being domiciled in an ultra-respectable suburb, the residents of which appear to be slaves to hide-bound convention, the amount of interest which is created and the comments which passed when, all dressed up, I sally forth to my garage down the road may safely be left to the imagination. Let it suffice that there does actually exist a class to which the

". . the comments which are

passed when I sally forth.

An Unheeded Warning.

Before leaving the Midland city, I had noticed an obscure paragraph in the daily paper to the effect that floods were in evidence at Towcester. Having weightier matters to consider, this was soon forgotten, and the journey was commenced in, needless to state, a heavy downpour. A rude shock was experienced at Willoughby, for there the main road was flooded under the railway bridge to such an extent that a Ford van, abandoned and forlorn, was so far submerged that only the wheels and floorboards of the body were visible. Local inhabitants were much in evidence at this point, thoroughly enjoying the sport, but, finding that I did not pander to their perverted taste by attempting a spectacular dash through the water, they, somewhat reluctantly I thought, proffered the information that, by making a detour, I could avoid the obstacle and regain the main road further

on. This proved correct, but was of no avail, as road again proved to be under water.

The Sport of "Water-splashing."

Having no lamps or further leisure to diverge fi the route. I determined to risk matters, and, v much hissing and splashing, dashed into the flo greatly to the delight of numerous bucolic spectate who cheered wildly. As might be expected, the eng stopped, but my waders kept me dry shod during operation of pushing the 'bus to dry land. No trou was experienced in starting up, and haste was made Towcester, where the tit-bit of the day was experienc Here a veritable torrent was rushing down the hill . across the road, finally falling, in a regular casca over a bank on the north side of the road. Has now gained confidence in the waterproof qualities my machine, I plunged boldly into the stream u the level of the water actually reached up to bottom of the petrol tank, when the engine stopy

Waterproof-Machine and Man.

I dismounted, and my trusty waders were just l enough to prevent the water from pouring in over tops. After a struggle, I succeeded in pushing thro and contemplated my dripping machine full of app hension as to the result of this further and more I longed immersion. Visions of laborious hours st on similar occasions in the past baking the "interna of my magneto flashed through my mind, while possibility of continuing appeared most remote. Ju of my astonishment when, on applying the kick-sta in a very half-hearted manner, the engine burst i life, and, without trouble, ran all the way to town.

It is on occasions such as these that the adopt of unsightly attire is fully justified. To set out brilliant sunshine and return in a rainstorm is, in t

country, quite a common occurrence, hence my willing-, ness to put up with any amount of adverse criticism as to Hutchinson my appearance. waders are invaluable, and, used in conjunction with an oilskin coat worn over an old British warm, enable one to

keep perfectly dry in the most torrential downpour. To fairweather riders, I would add that the sport that is obtainable, even mid-winter, from the pas-

"As might be expected, the engine

time is well worth the jeers and gibes which are frey bestowed upon one by the people who have new experienced its joys.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Heritord Street, Coventry, and must be accompanied by the writer's name and address-

PETROL CONSUMPTION.

Sir,-The following record of petrol consumption may be of interest. I have just completed 1,146 miles on thirteen sallons of petrol with an 8 h.p. Zenith and Canoclet sidecar. The distance is by Bonniksen speedometer, and I have kept careful record of all petrol purchased. The only fittings ther than standard are a drip feed lubricator to the front ylinder and the W.S.R. jet adapter. This means some MODEL G. Barnes.

Sir,-We get the impression from the press that the Scott notor cycle and other two-stroke engines are more extravacant in petrol than four-stroke engines of apparently equal

tant in petrol than four-stroke engines of apparently equal. p. Now, might I suggest a short trial, which would expose the actual consumption of the various makes for central equal h.p.? I presume the basis for comparison would be the b.h.p. credited to the engine.

It should be an easy matter to secure two or more nachines of equal b.h.p., and of the different pattern ngines. Equalise weight, petrol supply, etc., and send on a tour of predetermined distance—the drivers to change nachines when half the distance is accomplished. I feel me the would the result to excite the secret in sure the manufacturers would be only too ready to assist in his matter, and the results would be most interesting.

F. G. MOORE.

IDECARS FOR ESTATE WORK.

Sir.—In your issue of April 15th, page 429, is a photograph showing a motor cycle and sidecar on estate work.

You may be interested to know that the writer used one m this particular estate during the latter half of 1916 for he collection of reuts and getting the wages from Coventry, tc. The outfit used was a 1914 Coventry Excelsion 4½ h.p. ungle, with a 1916 Bramble steel body sidecar (no outside hassis), and was very successful in use. No doubt Mr. Jarson, of Excelsior fame, remembers the saw shed, which s situated to the left of the photograph, as it was used everal times for repairs; I also garaged there. It was sally a fine old bicycle; and although a motor cyclist and eally a fine old Dicycle, and authough a motor cycles and eader of your paper for some years, I do not think I have enjoyed the delights of the road more than when that bus, was in my possession. The usual disclaimer if necessary.

E. HOWARD SMITH.

ONDON-EDINBURGH RUN-ACCOMMODATION.

Sir,-I am up in "Auld Reekie" for a short holiday, nd have made a few enquiries about hotels for the London-Edinburgh run boys.

As usual a number have already booked up to stay at dilne's Imperial Hotel, 145, Leith Street, and there will

e the usual re-union there on the Sunday.

There are still ten to twelve double rooms available, and nyone intending to stay there is advised to write and fix, ip at once. Those who have stayed there before will emember the jolly times spent on pre-war Loudon to dinburgh runs, but some may not have kept the address.

HAROLD KARSLAKE.

RONT BRAKES.

Sir,-It is incomprehensible to me, a motor cyclist of ome years experience, that manufacturers continue to fit he ridiculous and useless front rim brake. It is obviously relic of the pedal cycle, and yet is fitted by makers who ride themselves on their product being a motor cycle, not glorified pedal cycle. Even if it were efficient, its use would soon ruin the appearance of the machine, and, in any case, the front rim is not intended to be used as a brake surface.

It is surely time that this survival of antiquity disappeared, and I am convinced that you would have the gratitude of almost all motor cyclists it you were to use your efforts in this direction.

Some of the new and more progressive firms are now fitting sensible brakes, but many of us like to stick to one of the older makers, most of whom have hardly improved the hand brake since they produced their first machine.

Richmond.

SPEED WOBBLE.

Sir,-May I take up the gauntlet thrown down by "Limit"? I have attained the speed of 60 to 65 m.p.h. on several occasions lately on various stretches of the Portsmouth Road. My machine is a 7-9 h.p. Indian, single speed model. I have touched 70 m.p.h. on the track, timed by friends, although my speedometer reads quite correctly.

ny speciometer reads quite correctly.

Admitted it is foolish and dangerous to drive so fast; but, nevertheless, it is most exhibitrating! I have never yet had a speed wobble on this machine, but I experienced it once on a machine with a back rim out of truth at just over

45 m.p.h.

If you have room for this statement in your most excellent journal, I should like to bring to the notice of "Limit" that, to obtain these speeds, he must tinker his engine till it will give the necessary revolutions, and then try a few stretches on the road I mention, and if his luck is out he will NO-LIMIT. be heavily fined.

London, W.

Sir .- Regarding the vexed question of "speed wobble," a point which appears to deserve attention is the fact that a point which appears to deserve attention is the fact that few machines are constructed so rigidly, with regard to power-transmission to the rear wheel, as to eliminate bending effect due to tension of chain, or belt, as the case

may be, while running.

When the power transmitted reaches a certain value, When the power transmitted reaches a certain value, while the machine on the level touches the critical speed, a certain amount of "whip" in the rear fork, due to bending moment towards the driving side, is unavoidably present, however small. If this vibration is of sufficient amplitude, it follows that the path of travel will be affected thereby. It may be of interest to note that in some extreme cases of light frames built for racing events, the rear fork and wheel is set initially out of alignment in order to compensate for tension of drive entailed by power transmitted at high speeds.

It would be interesting to know whether any of your readers have traced the trouble down to the source indicated. GEO. DE M. DAVIS.

Sir,—I was interested to see "Limit's" letter in your issue of April 22nd with regard to speed.

I quite agree with him, and endorse all his remarks about wonderful speed of men who, so they tell us, do

65 and 70 m.p.h. on the road.

Like "Limit," I should like to know how a speed of nearly 70 m.p.h. off the track is done, and more than that, I should like to see it done.

It is a pity that speedometers do not always tell the truth, and it is more than a pity when this remark extends to the riders themselves. Malvern.

FINISH OF NEW MACHINES.

Sir,—Your correspondent, Mr. A. Brown, in *The Motor Cycle* of April 15th, raises a subject under the above heading which, I feel sure, motor cycle manufacturers would be well advised to consider.

About a formight ago I got delivery of a machine which is largely advertised, and it is only within the last day or two that I have got it into what I consider good running order. This is not what one expects after paying a pound or two under £100 for a 2\frac{3}{2} h.p. cycle. I have no fault to find with the engine (a Blackhurne) or the frame generally —the makers state in their catalogue that it is "the last word in motor cycle design," and so it should be at the price—but the way in which it is put together leaves much to be desired.

Had I been a novice. I should certainly have condemned the outfit as bad. As it happens, I have had considerable experience with the Capac carburetter, with which this machine is fitted, so I was able to adjust it immediately in order to start up the engine. Once adjusted, this carburetter, to my mind, is hard to beat. Both brakes are of the external contracting type on the rear wheel. Owing to faulty workmanship, these were hard on all the time, and had to be dismantled and corrected before the wheel could be turned.

After a run of five miles, the footboards were loose, the steering head had excessive play, and the rear mudguard polished inside, owing to the rear wheel, which is sprung fouling it on rough roads. Many other minor adjustment were necessary, and several nuts had to be tightened up.

Besides being dangerous to unskilled riders, a machine in such a condition does not give the makers of components such as engine, carburetter, etc., a fair chance, since many riders look upon an assembled cycle as a whole, and i received in bad condition the whole is condemned.

The above state of affairs is not usually found in machine manufactured throughout under one roof. It is more in the case of assembled machines, and I think engine makers am manufacturers of components would be justified in refusing to supply those makers who turn out badly-built machines.

It is only by the most careful inspection that cycle maker can be sure of their products being in good condition.

The plating of modern machines also leaves much to be desired. The machine to which I have referred has bee in one shower of rain, and all the plated parts show rust My Baby Triumph, which I have run daily throughout th winter, looks better to-day than this machine after a for night's running. What is possible with one make should be possible with another.

D.B. Milngayie

STARTING TIPS.

Sir.-In reply to "J.M.M.'s" query re starting a B.S.A'., there are several points to observe :

1. The clutch plates are probably stuck, and should be taken down, cleaned, and replaced. I removed one plate in

my machine, and found an improvement.

2. Thin water-cooled engine oil only must be used for

the gear box.

 When cold, the engine must be primed every time.
 Scrap the carburetter, and put on one which cannot be meddled with on the road. The adjusting needle on the CAP.-B.S.A. is a source of much anxiety.

5. Always use benzole, as the B.S.A. is a different

machine when this is employed.

6. It is presumed that "J.M.M." starts with the lever in low gear when kick starting. If he ever pushes off, middle gear should be used.

C.B.M.-B. Huntingdon.

LADIES AND COMPETITIONS.

Sir,—I heartily agree with, and share, Mrs. Manvell's feelings on the subject of ladies and competitions. I believe teenings on the subject of ladies and competitions. I believe I live in the same district as Mrs. Manvell, and suggest it might be a good plan to start a motor cycling club solely for ladies, and have our own trials, competitions, and hill-climbs—yes, and even speed tests! There must be ever so many lady motor cyclists living a few miles out of London who would be only too glad to join such a club. I myself am a 23 b.p. Douglas enthusiast, and am expecting delivery of my new machine this week. LADY RIDER.

Beckenham.

TAXATION.

Sir,-In the course of the debate in the House of Commons on the resolution imposing new duties, the hon, member for Tottenham, in discussing the position of the private motorist in regard to the upkeep of the roads, was surely at a loss for adjectives when he described the attitude of the Auto-mobile Association and Motor Union as "selfish."

First, the Taxation Committee were asked to deal with the taxation of road vehicles, and not merely motor vehicles, but the report of that Committee is confined to endeavouring to show how the whole amount can be obtained by taxing motor vehicles alone. Moreover, the obtained by taxing motor vehicles alone. Moreover, the private motorist is called upon to find the larger share of the total sum required. All the Association is asking, on behalf of the private motorist, is that he shall be entitled to the impartial consideration of his opinion as to the most equitable means of finding the money. Where is the selfishness in this? On the contrary, whilst the principle of taxing vehicles for road revenue has been maintained by the authorities, the Association has always indicated the willingness of the metarist to find a fair where of the apparent willingness of the motorist to find a fair share of the amount required. The method by which it is proposed to levy this mcreased taxation is entirely wrong in theory, and would be unjust in practice, as it is obvious that the amount of the individual tax should always vary in accordance with the extent to which the road is used.

I also notice that during this debate the Minister of Transport, in referring to the fact that the only objection to the tax had come from the Automobile Association, did not at the same time make it clear that this opposition is the voice of 115,000 owners of motor vehicles who are members of the A.A., and that the policy of the Association is supported by private motorists as a body throughout the

United Kingdom

The Automobile Association will continue to fight for the retention of taxation upon imported petrol as against the inequitable proposals for taxation per unit of horse-power, as motor spirit is the only fair basis which bears any direct relation to the extent of use.

STENSON COOKE, Secretary A.A. and M.U.

Sir, After reading your various comments in The Motor Cycle for April 22nd, I gather that the general opinion is that taxation should be in proportion to the use made of the roads by the cycles or cars in question. I agree that, from the view of the owners, the fuel tax is the fairest and the easiest in many cases, as it would be paid gradually.

The Government, however, refuse to continue this tax for reasons set forth in your article headed "Taxation," referred to above, wherein you also say there is no fair alternative.

Why not a tax on tyres, as I suggested before? This would

be fair, to all motorists at any rate, and would not have the objection of being hard to collect.

For the more a machine is used the more wear on tyres and the more reckless the driver the more wear on tyres and roads owing to skids and hard use of brakes. The week-end user would thus be fully provided for, and the continual user would pay his fair and larger share.

As regards collection, this could be done (1) at the makers, and (2) at the retreaders. The former would present no difficulty. The latter could be overcome by causing anyone who does retreading to be licensed at a nominal fee and to keep books as were required for petrol licences. A tax could be added by the retreader to his charges, similar to the enter-

tainment tax.

The exact figures or amounts of these taxes could only be reached by those having access to the necessary data; but, whatever the amounts finally settled on, they would still be proportionally correct from the standpoint of damage done to roads.

No one will deny, I think, that the larger and heavier the tyre the greater the damage done to the roads. In conclinion, I do not think any motorist minds paying towards the upkeep of the roads, as good roads save pounds in the repair bill and add very much to the comfort and cleanness of riding, but all object to paying more than their fair and just share. I would suggest doing away with all present taxes and having all in one. H. W. HILLS. present taxes and having all in one.

Sir,-I propose buying a machine at the end of the Sn; 1 propose buying a machine at the end of the season (as I am at present a hospital patient), and my first thoughts turned towards a 3_2 h.p. machine with sidecar. With the old tax I should have been able to bear the usual expenses, but now I shall have to turn to one of the

other two alternatives, viz., a lightweight under 200 lb. Now comes the question: Is the 200 lb. to be the weight of the machine stripped of accessories, i.e., lamp set, alarm, and tools, or the weight of the machine ready for the road complete with the above accessories?

If the latter statement proves correct, I think that it would be in the interests of lightweight manufacturers to turn out a complete machine, ready for the road, under or up to the specified 200 lb. F. HANSON.

Sir,-As a reader of your paper since 1905 and a motor cyclist since 1907, may I give my views on the unfair system of taxation proposed in the new Budget? Is it not time motor cyclists protested as a body, not only as regards taxation but against every form of persecution from which we suffer, surely our numbers are now great enough to make some impression on those responsible for the state of things. We keep taking every new imposition quietly, but I think this last blow ought to waken every motor cyclist up. If the country wants money for the upkeep of roads, why should the motorist pay it all? What about the big farm carts and lorries, and all horsed vehicles, also pedal cycles? The new tax on motor cycles is going to make motor cycling impossible for a lot of working men, and they are the men that require it most. J. FIELDING.

Railway Bookstalls.

MASS PRODUCTION AND COSTS.

The Summary of a Talk with a Prominent American Manufacturer.

If it were not for the present unfavourable rate of exchange and the import tariff, the powerful American sidecar outfit could be sold in this country at a figure in the neighbourhood of £150. Yet wages in the U.S.A. are even higher than in this country.

The significance of these facts was brought home to us during a talk with Mr. Arthur Davidson, of the Harley-Davidson Co., who at present is on a visit to

this country.

We were impressed by the possibilities attainable by any firm which can properly organise its plant and adopt methods by which a large output is rendered possible. Employees at the Harley-Davidson factory number 2,000, and the output is well over 20,000 machines per

over 20,000 machines per annum, or roughly one

machine each month per man.

Mr. Walter Davidson has a reputation of being a ruthless "scrapper" of machinery, with the result that the Harley-Davidson factory is always up to maximum efficiency by the constant introduction of the latest time and labour-saving machinery, a large proportion of which is made in their own factory.

Despite their success, the gentlemen from whom the machines take their name practically live at the factory, and so cordial is the relationship between employers and employees that labour troubles are

reduced to a minimum.

Mr. Davidson told us that there are no secrets in the manufacture of Harley-Davidson machines. Only the best materials were used—an efficient laboratory saw that no materials differing from specification passed into production—and, if any British manufacturer cared to go over their factory in Milwaukee, the door was open and a hearty welcome awaited him.

We were led to understand that the flat-twin model is made by practically a separate plant, added to the factory specially for its production, and that during experimental stages a smaller engine was first made but was not considered sufficiently powerful for solo use in America and the Antipodes.

Mr. Duncan Watson (Mayor of Marylebone) driving Mr. Arthur Davidson, of the Harley-Davidson Motor Co., Ltd. Mr. Davidson has just arrived from America to study European conditions

Although a T.T. Harley-Davidson has been produced by the experimental department, it will not be seen in England this year, and we gathered-that the decision of some of our leading makers not to support the race has had something to do with this. Of course, the chances of winning the Blue Riband of the motor cycle world are greater this year than ir any of the contests in the past and likely to be in the near future, but the company had no desire to race with other than a thoroughly re presentative British entry This T.T. model is a smal V twin, and not a flat twin as might have been expected since the flat-twin Harley is only a little oversize for the T.T., having a capacity o

Referring to the "oversize" (1,100.9 c.c.) model which recently covered nearly 112 miles per hour a Daytona. Mr. Davidson told us that the chances of its being seen in this country are small, as, at the present time at least, there is no intention of marketing it.

The Question of Production.

Asked for his impressions of British motor cycles Mr. Davidson replied that there were too many and not enough of any one of them, while he was almos bewildered by the multitudinous sidecars produced it this country, which he thought were being over developed.

In contradiction of the rumours current from time to time, there is no intention at the present time of opening a factory in Great Britain. Mr. Davidso explained the many difficulties, and was extremel doubtful whether a British Harley-Davidson could be made to give any advantage to purchasers in this

country.

He paid tribute to the popularity of *The Moto Cycle*, and stated that he had found the blue covered paper in every part of the world where motor cycle are used. He remarked that the enormous circulatio (over 120,000 copies weekly) for a "class" journal was remarkable and a source of astonishment in his country.

A SCOTTISH OPEN HILL-CLIMB.

N Saturday, the 15th, the Western M.C.C. of Glasgow will hold an open hill-climb on Garshaike Hill (Dumbartonshire), which is about fourteen miles from the Scottish Metropolis. Five classes are provided for: up to 350 c.c., 600 c.c., and "unlimited" sidecars.

The awards will be made on time and also of formula, while a special prize will be awarded to novice member of the club putting up the best pe formance on formula. Entrics close on the 13th, an should be sent to Mr. P. Napier White, Sunnybanl Campsic Road, Hillpark, Glasgow. Practising on the lill is not permitted.

Hints for the London-Edinburgh Run.

A Few Notes on the Classic Whitsuntide Event by the Captain of the M.C.C.

IT is highly desirable that competitors in this year's London-Edinburgh equip their machines with magneto cut-outs for the descent of Kirkstone Pass, writes Mr. W. H. Wells, captain of the M.C.C.,

who has just surveyed the course. Without a means to cut off the ignition on the descent into Patterdale, it will not be possible to use the low gear to full advantage for braking purposes, and those who depend entirely on their brakes may burn them out.

Alterations in the Course.

The course definitely decided upon is as shown on page 465, The Motor Cycle f April 22nd, with the exception that instead of including Wetherby and Harrogate, it leaves the main road a mile and a half south of the former town, where the road from Tadcaster town, where the road from Indicaster meets the Great North Road and diverts to the left through Harewood, Poole, Otley and Ilkley, where breakfast will be served at the Middelton Hotel, then on to Skipton.

The roads are in excellent condition from London to a point about five miles beyond Doncaster; then rather rough until the Great North Road is left, after which the road is extremely good all the way through to Kendal. From all the way through to Kendal. From Kendal to Windermere there is about a quarter of a mile of bad road, after which it is remarkably good to Crook Inn, where about two miles of bad road is encountered. The road is then exceptionally good right through to Edinburgh,

TRADING WITH FORMER ENEMY COUNTRIES.

The following resolution has been passed by the Council of the British Association of Trade and Technical . Journals, Limited:

"In view of the expression of opinion by Sir Auckland Geddes, as President of the Board of Trade, regarding the acceptance of advertisements of goods manufactured in late enemy countries. the Council have carefolly considered the whole position. They now recommend members to adhere to the adopted policy of the Association not to accept such advertisements for the present, in order to enable British manufacturers to recover their normal working conditions, At the end of the present year (1920) the subject will again be considered, with a view to further advising members on the subject."

The publishers of "The Motor Cycle" readily accept this recommendation, and have, in fact, constantly refused offers of advertisements of German goods.

The ascent of Kirkstone Pass from-Ambleside resembles Porlock in gradient, especially for the first one and a quarter miles, but it is easier to climb, in view of the fact that the road has a hard stone surface, which allows a good wheel stone surface, which allows a good wheel grip under all conditions of weather. The last three-eighths of a mile up to Travellers' Rest is fairly easy, although the last hundred yards' stretch, known as "The Struggle," is probably 1 in 4.

Accommodation.

It has been very difficult indeed to secure hotel accommodation along the route, but the hotels that have agreed to accommodate the competitors, such as the George at Grantham, the Middelton at Ilkley, Patterdale Hotel, Patterdale, and Annerdale Arms at Moffat, are first-class hotels, all of which have their regular and permanent goests. They, therefore, look to the members of the M.C.C. to remove their overalls, riding clothes, waders, etc., before entering the dining room.

Entrants must remember that the times now are very different from what they were in pre-war days, and should refrain from grumbling if the service should not come up to expectation. If there are any complaints forthcoming, it may mean that in future years the club will be unable to obtain any accommodation

Results of the Victory Cup Trial.

A 250 c.c. lightweight won the Victory Cup in the Birmingham M.C.C.'s recent trial in which 165 riders competed. This machine is a special Diamond mount with overhead valves and camshaft, ridden by A. Milner. The following are the official results:

VICTORY CUP AND GOLD MEDAL. (For best performance.)
A. Milner (21/2 Diamond).

MIDLAND CUP AND GOLD MEDAL. . (For best performance in the passenger class.)
J. E. Greenwood (3½ Sunbeam sc.). DUKE CUP AND GOLD MEDAL.

(For the competitor in the solo class above 275 c.c. who had the greatest number of marks to his credit.)

F. A. Applebee (3 A.B.C.).

ALEC ROSS PRIZE.

(For greatest number of marks on a machine under 270 c.c.)

A. Milner (2½ Diamond).

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Altering Compression Ratio.

Would you kindly inform me what possible effects would occur in my 24 h.p. two-stroke by putting a packing piece between the cylinder and crank case, thereby lowering the compression ratio? I have been thinking of trying this on my machine with different sized packing pieces, but before experimenting I should be glad to have your opinion.—W.A.W.

You do not state for what reason you wish to vary the compression ratio on your machine, but we would advise you not to make an alteration, as by raising the cylinder you will alter the port timing, and probably lessen the efficiency of the engine to a greater or less degree, varying with the thickness of the packing used.

Defective Carburation.

I have a 33 h.p. machine, fixed engine, which I have had recently overhauled by the makers, a new cylinder, complete with valves, etc., being fitted, and, in my opinion, the engine is in perfect order. When I purchased this machine there was fitted an old type carburetter. The float chamber would not fill, and, acting upon information received from you previously, I in-serted a thick leather washer under the lid. This allowed the float chamber to fill, but all the time I have had the machine, both before and after overhaul, it is impossible to get more than twenty-five or thirty miles per gallon. Flooding will only occur after violent "tickling." In spite of all the efforts of myself and the local garages, the machine is most difficult to start, sometimes requiring to be run sixty or seventy yards, never less than thirty yards. Is this machine, than thirty yards. Is this machine, a 33 h.p., capable of taking a sidecar over moderate or fairly level roads, provided I had a simple variable gear fitted?-Novice.

From your description of the trouble, it would appear that the petrol level in the carburetter is too low, and, as the carburetter appears to be completely out of adjustment and of an old pattern, we should recommend that you fit a new one. The petrol consumption with your machine should certainly be 90 m.p.g., and the starting should not be at all difficult. The machine would be reasonably successful with a light sidecar on level roads, especially if you fitted a Philipson pulley, the latter being of the special model made for sidecar work.

Carburetter Trouble.

I ride a 1915 Baby Triumph, with a Triumph (?) carburetter, with the petrol feed from the bottom. The engine requires full air, with about half throttle, and with full throttle it vibrates badly. The benzole consumption is high, and a fine deposit forms in the cylinder. (1.) How can this be remedied? (2.) How is the jet removed? (3.) Would a W.S.R. adjustable jet improve the running? (4.) Would a hot air intake be an improvement. (5.) What alterations are necessary for running on benzole?—G.S.S.

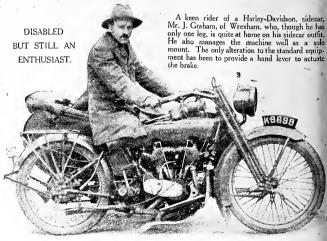

(1.) Your trouble is apparently caused by too rich a mixture, and we should therefore recommend that you experiment with the lowering of the petrol level, and the fitting of a smaller jet. The vibration might be caused at full throttle opening by pre-ignition, which is caused by the presence of incandescent carbon deposit in the combustion chamber. (2.) The jet can be unscrewed when the float chamber is removed from the body of the carburetter. (3.) If the adjustable jet you mention can be fitted it would greatly facilitate tuning and experiments. (4.) This is entirely a matter of opinion, but, in cold weather, it might be an advantage. (5.) An in

crease in the supply of air to the carburetter, or a slight reduction of the fuel supply, effected by reducing the jet size or lowering the level.

Date of Machine.

I bought an outfit in December 1919, for £78, and, as a result of certain observations recently made at a garage concerning it I wrote to the makers, quoting frame number (which had been covered by enamel, and received a reply stating the machine was a 1912, not 1914, a divertised and as stated on the receipt What is my position now? I want is sell, but cannot honestly advertise is as a 1914 machine. Can I get the vendor to take the machine back an refund the price I paid?—G.B.

Before you can insist upon the selle taking back the machine, or returning a part of the purchase price to compensate you for the difference in value between the 1914 and 1912 model, you will have to prove that his statement of the date was deliber ately made with the intention of deceiving you, and so obtaining a higher price for the machine than it was actually worth Consult a local solicitor, with a view to obtaining some redress from the seller as, presumably, being a dealer, he should have known the age of the machine.

Cycle Car Gear Ratio.

I require a top gear ratio of 43 to 1, and my present gear box has a top gear ratio of 4½ to 1. has a top gear ratio of 4½ to 1.

Driven sprocket on gear box, 36 T, 5in. pitch; countershaft rulleys, 7in. diameter; belt rims, shaft pulleys, 7in. diameter; belt rims, 17in. diameter. What sprockets do I require on engine and countershaft ?-

you retain the 36T x gin. pitch sprocket the countershaft, you will require an T sprocket of the same pitch on the ine-shaft to give the top gear ratio of to 1 (approximately), retaining the sting pulley and belt rim.

Cause of Hub Gear Breakage.

Will you be good enough to give me all possible causes of a 3 three-speed spindle breaking inside the internal clutch cone? The machine in question is a 914 model, and has broken two pindles, one doing 80-100 miles, the ther about 50 miles. Can you help me a this matter?—H.C.W.

ere are many faults which would cause ir three-speed hub spindle to break, ongst them being a loose fit of the ndle itself in the fork ends; a fierce tch; hanging on to top gear to the t moment; the whole or partial sure of the gear mechanism due to ufficient lubrication; broken portions the pinions getting mixed up in the chanism, and bad driving, which was the full shock of the engine imses at low speeds to come on the gear. u might also carefully check the lining. of the fork ends, as if these are bent twisted in any way, considerable ass will be imposed upon the spindle, I any further shock, through any of causes mentioned, would possibly ise the actual breakage to occur.

The B.S.A. Gear Box.

the following matter: There is an intermittent occasional slip in my B.S.A. gear box, accompanied by a scrunching grating sound, specially when taking a loaded sidecar p a hill on second or third gear. When the sound ceases the load is again aken up for a short distance. What want to know is whether the B.S.A. ear box is such that a good amateur actor cyclist (who does all his own unning repairs and replacements) can afely and easily take it apart for xamination, or is it a job for the

Would you please advise me in

akers ?-F.D.T. re is no real difficulty in dismantling B.S.A. gear box and clutch, but a ain amount of skilful manipulation thought are necessary. No special s are required, as the tension can be en off the clutch springs by means of chtch push rod itself and the help a large vice. Your best plan would to obtain the makers' spare parts cata-ies, which illustrates the whole of the ponents separately. This will be some if to you. The trouble you experience le to you. The trouble you experience indoubtedly due to clutch slip, and possibly result from the use of unable oil. Engine oil on no account ild be used—a very thin lubricant what is required.

Graphited Oils.

The Graphite Oils Co., Ltd., of Glasgow, are issuing shares to the extent of a quarter of a million new capital with a view to enlarging their plant.

Increased Prices.

Owing to the continuous advances in wages and cost of materials, the price of the standard two-seater T.B. has been increased to £250.

The price of the Levis two-stroke Popular model is now £60. This increase took effect on the 1st inst.

American Electric Horns.

Replacements for the electric horns fitted as standard to most American machines can be obtained from Messrs. R. Cadisch and Sons, 171, Great Portland Street, W.1, who are making them under licence to the specifications of the Dean Electric Co., of America.

Competition Rider and Garage Proprietor,

Mr. Eric Williams, the well-known competition rider, has recently opened new showrooms and garage, including a well-equipped workshop, at Lowesmoor, Worcester, where repairs are carried out under Mr. Williams's personal supervision.

Plug Tips for Plug Users.

An interesting little booklet bearing the above title has just been issued by the Apollo Manufacturing Co. It tells the motor cyclist much more about plugs than probably he ever knew before. Interesting figures are given showing the conditions under which a plug is used. A treatise on insulation and the theory of electric spark ignition is also included.

Goodyear Tyre Enterprise.

A series of interesting films, embodying the Goodyear Factory and long distance hauling by the Goodyear Akron Express on Giant Pneumatics, are now being shown to the trade in various towns throughout the country. Goodyear Tyre Co. certainly show no lack of enterprise in their methods of publicity.

A Travelling Motor Repair Agency.

We have received a pamphlet concerning the Travelling Motor Repair Agency, run by ex-officers at Golden House, Great Pulteney Street, London, House, Great Pulteney Street, London, W.1. The primary objects of the agency are to repair all types of cars and motor cycles at the owner's residence, to buy and sell cars and motor cycles, to give and sell cars and motor cycles, to give instruction in driving and mechanism, also insurance. The Agency clairs that on receipt of a wire or telephone message, specially qualified men will be despatched immediately to any locality. They also state that repairs are charged by the hour, and that all spare parts are sold at cost price.

1# DAY ++

Start from Perth, include a Run to John-o'-Groat's, and Finish with One Day South of Edinburgh.

THIS year's Scottish Six Days Trials promise to be the most severe of any yet organised. At the same time, none of the usual sporting characteristics will be lost, and those who compete will no donbt have as enjoyable a time as on any previous Scottish "Six Days." For the first time Edinburgh will not be the starting point, and another innovation is that one day's run will be south of that city.

London competitors will have to travel about 430 miles to the starting point at Perth—a long distance trial in itself, excepting that, of course, they may travel by train if they desire. They rarely do this, however, and the majority of competitors travel by road, and there-by assure themselves that their machines are in every way fit to start on the strenuous 1,000 miles over the worst hills in the United Kingdom.

Neither Applecross nor Aultnaharie, (last year's pièce de résistance) will be included in this year's trial. Other hills associated with the Scottish Trials are also omitted. Several new hills are included, and Abriachan, which was omitted last year, will apparently be climbed twice (on the second and fourth days). New hills include Talla Linns and Redstone Rig, which are not unknown, as the Edinburgh club has included them in its recent one-day trials.

On the third and fifth days no observed hills are included.

The following are the six routes pro-The observed hills are shown in capital letters.

First Day, Monday, July 5th.

Perth, Methven. Buchanty, Newton Bridge, AMULREE. Kenmore, Aberfeldy, Grandfully, Ballin-

Grandtully, Dannie luig, Pitlochry, Moulin, Kirkmichael, Braemar, Crathie, Rin-loon, Corgarff, COCKBRIDGE, Tomintoul, Bridge of Avon, BRIDGE O'BROWN, Grantown, Carrbridge, Findhorn Bridge, Inverness.—1733 miles.

ABRIACHAN.

Second Day. Inverness, ABRIACHAN, Beauly, Muir of Ord, Dingwall, Evanton, Ardgay, Bonar Bridge, Lairg, Althaharra, Tongue, Bettyhill, Strathy, Melvich, John-o'-Groat's, Thurso.—186½ miles.

Third Day. Thurd Day.

an-Ladysmith Race.

non-stop reliability trial from Durban adysmith and back, held on April proved a strenuous affair, only six of seventeen riders arriving as far as ysmith; only five completed the full ney.

ie winner of the Lambon Trophy, a for fastest time on a sidecar, was 'arks (Indian sc.), J. Booth (Junior mph) taking the Rudge Trophy, h was awarded for the best time on th was awarded for the best time on old mount. The handicapping was nendable, as demonstrated by the that a Harley-Davidson (solo) hed only 7½s. hehind the Triumph. ompleting the course—some 310 miles, rough roads—the competitors put up creditable performances, particularly n the case of Booth, who rode an llent race on his small machine, his age speed being 21 m.p.h.

Tax Tyres?

In the discussion last week in the House on the proposed new schedule of motor taxation, Mr. Pemberton Billing revived the suggestion of a tax on tyres. Minister of Transport announced that a workable scheme would be considered.

Stolen Machine.

A 1920 6 h.p. Royal Enfield has been stolen from Mr. R. G. Strutt, Afterglow, Wadhurst, Sussex—engine No. 67,586, frame No. 14,947, sidecar chassis No. 14,056. The machine is fitted with Magdyno lighting and Cameo windscreen.

What is a Scooter?

If a motor scooter is not a motor cycle, as some affirm, it is indeed difficult to find the line of demarcation, for it is certain that neither frame design nor engine size determines the respective types, hence one can only assume that wheel size decides the point. Nevertheless, however small a machine may be, it is still a cycle. Most of the so-called scooters bear not the slightest resemblance to the child's toy, the name of which was first used by The Motor Cycle in connection with a machine that had some of the scooter's characteristics.

Special Features.

ROAD TESTS OF NEW MODELS. TOURIST TROPHY NOTES. 1920 SCOTTISH SIX DAYS ROUTE.

A Suggestion.

We have from time to time received We have from time to time received complaints from readers that the sharp portions of the A.A. ladge often cause minor injuries to clothing or hands. Possibly the design might be modified so that there are no sharp edges to give trouble in this direction.

Over 115 m.p.h.!

In the issue of April 22nd we published particulars of many new speed records set up last February on Daytona Beach by Harley-Davidson machines. News of still greater speeds has been recently received from over the water. On April 15th, and 16th the Indian racing experts made a successful attack on the above-mentioned records, covering the mile, with an eight-valve (998 c.c.) the mile, with an eight-varie (550 c.C.) Indian, in 31, 1s. at the remarkable speed of 115.7 m.p.h. The same distance was made in 34s. by the Powerplus model, equal to 105.7 m.p.h., while a speed of 87.8 m.p.h. was attained by a four-valve (550 c.c.) Indian

(500 c.c.) Indian.

The British record for this distance with a 500 c.c. engine is 78.95 m.p.h.

The winning sidecar in the recent Durban-Ladysmith race. J. Parks, on the Indian illustrated, received quite an ovation on his arrival at Ladysmith.

MOTOR CICLE

London-Land's End Awards.

In addition to awards in connection with the London-Land's End Trial, already published in this journal, we are informed by the organising authorities that R. E. Darnton (8 Sunbeam sc.) has been awarded a gold medal.

Helpers Wanted.

A number of keen motor cyclists are required as observers in connection with the Lycett Trophy Trial from Birmingham to Land's End and back. These will be stationed at Porlock and Lynton on the outward journey on the 22nd inst., and on Countisbury on the 25th during the return. Any motor cyclists willing to assist in this respect should communicate with the hon. sec., Mr. W. H. Egginton, 76, Earlsbury Gardens, Birchfields, Birmingham, who will also furnish full particulars of this event to intending competitors.

An Inter-club Team Trial.

June 5th has been fixed for the interteam reliability trial for the Mandes challenge shield. Teams will be composed of three solo motor cycles of any c.c., and three motor cycles and sidecars of any c.c., with one solo motor cycle and one sidecar outfit as reserves. Clubs will nominate one team only. The course will be a secret one, consisting of circuits of 25 or 35 miles in length, which shall be covered four or three times respectively making 100 miles in all. The organising secretary is Mr. W. Pratt, c/o Maude's Motor Mart, 100, Great Portland St., London, W.1.

News in a Nutshell.

The Scottish light car trials have been abandoned.

Reflex lights are not suitable substitutes for rear lamps on bicycles, according to the report of the Ministry of Transport Departmental Committee on Lighting.

Lighting.
Ladies will be allowed to compete in this year's Scottish Six Days Trials. A comparatively large entry from the fair sex is expected.

The Commissioner of Police for the Metropolis has issued a warning to motorists who permit their number plates to be obscured by mud or dust.

Electric transmission is coming to the fore in cars. Shall we have petrol-electric motor cycles?

30,000 Government aero engines are

available for sale.

In January fifty-three American car manufacturers turned out 118,310 cars, an

average of 678.9 per working day.
The capacity of the engines in the new
Indian T.T. machines is 494 c.c.

"THE MOTOR CYCLE" INCREASED PRICE.

Owing to the advance in the cost of paper since January 1st, 1920 (apart from production costs generally), it has become necessary to increase the price of "THE MOTOR CYCLE" to 4½d, from the next issue.

When it is considered that the paper in each copy of this issue of "THE MOTOR CYCLE," which before the war would have cost approximately three-farthings, now costs over 33d., it will be apparent that the additional price does not cover the whole of the increased cost, but merely represents the reader's contribution.

The advertisers and the proprietors also have to bear their part, but since we hope the high cost of paper is only temporary, we, as proprietors, are prepared to shoulder a large proportion. The very success of "THE MOTOR CYCLE," as evidenced by its large circulation, makes its position the more difficult.

Readers may rest assured that the price will be reduced immediately conditions permit.

ILIFFE & SONS LTD-

As in previous years, arrangements in hand for The Motor Cycle telegrow the T.T. course to be displayed the chief motor cycling centres. For who have suitable means to display the telegrams and wish to do so should a municate with the Editor.

Essex M C. Hill-climb.

A Difficult Week-end Course. The Traders' Trophy Competition, organised by the Sheffield and Hallamshire M.C.C.

one goes into Yorkshire and runs ato an acquaintance, who is also a atotor cyclist, the first thing he will you is that he has found a new hill. Yorkshireman is at his happiest r when he sets before you a mighty of sets before you a mighty hill; obt cases he will say, challengingly, av tackle that!" and judges you our appetite or your climbing ability, hen a hot-stuff mountaineering trial view, trust the men of the broadle county to find something suitable, her it be a joy-ride amongst thems, or an open event.

On Team Trial Lines.

e Sheffield Traders' Trophy, for the Sheffield and Halamshire C. is trustee, is a cup presented by motor cycle traders of the city, to ompeted for by teams of six, three and three passenger machines. Each represents one of the traders, and etition is very keen.

lowing the lines of the M.C.C. Inter-Team Trials for The Motor Cycle last Week's event was on a short e which had to be covered three, non-stop rules being observed ghout.

A. Handford (trials hon. sec.), ed to break new ground without far out of Sheffield, and conselv secured the invaluable aid of Mr. surveyor of Stocksbridge, and in quence a most arduous twenty-seven circuit was planned. Though but miles from the centre of the city, oute began to be difficult from the encement, and the first ten miles do ut many of those who started. In Bridge was the first point of in, but the severe climb with right

J. Beet (8 Acme sc.) and E. Searle (4 Triumph sc.) approaching the hairpin above Midhopestones reservoir.

and left hairpins did not offer serious resistance. After traversing a mile or two of beautiful moorland road, what appeared to be an almost vertical ascent, known (perhaps wisely) as Wind Hill, was tackled. This was about 200 to 300 yards long, with a gradient of one in four, and a loose surface.

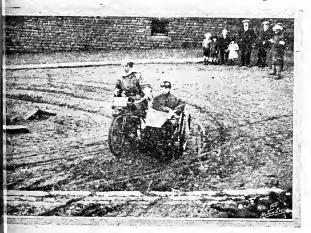

A section of excellent and quiet lanes next appeared, and after one or two sudden turns the riders were confronted with a steep descent, about 1 in 3½, at the foot of which lies Stocksbridge. In the strestvor. latter place someone had removed the arrows, and this was the only defect noticed in the route marking. Stocksbridge being "in a hole" was left behind by climbing one of those typically West Yorkshire hills having paved gulleys at intervals. To make matters worse, a fierce hairpin and a gulley led on to about half a mile of single figure gradient, enlivened by several outcrops of rock.

No Lack of Power.

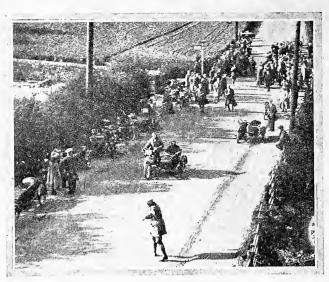

Of the thirty riders comprising the five teams it was noticed that very iew failed from lack of power; indeed, of the larger machines only one—a Brough—appeared to be in difficulties on the hills. Specially good climbs of Stocksbridge Hill were made by F. B. Roper (7-9 Indian sc.), A. Budd (53 Scott), F. W. James (8 Morgan), W. James, sen. (8 Morgan), Dan Bradbury (4 Norton sc.), and L. Radley (4 Triumph sc.).

A long and steep descent with a beautiful surface brought the competitors down to the valley again, and in climbing the other side, near a reservoir, a bad left-hand hairpin was almost immediately followed by one of even greater acuteness to the right. Most of the solo men attempted to take this too fast, and shot over the road into the grass. On his second round S. Russell (4 Norton) rode about thirty yards in the ditch before he could regain the road, but he did not stop. The Morgans, by skillful handling, all came round well, but they had no room to spare. Others who cornered well were J. Beet (8 Acme), who ran very consistently, R. Stacey (7-9 Harley-Davidson sc.), and S. Raynes (8 Enfield sc.), while L. Radley (4 Triumph sc.) did not appear to be happy with the right-hand bend.

A fairly easy run brought the first circuit of twenty-seven miles to an end,

. B. Roper (7-9 Indian sidecar), captain of the winning team, crossing the paved gulley on the first hairpin of Stocksbridge Hill

At the finish of the Sheffield Traders' Team Trophy Trial. S. Raynes (8 Enfield sc.) checking in.

and on this part, strange to relate, Dan Bradbury (4 Norton sc.) momentarily stopped his engine, thus dropping out. The following failed to complete the

first circuit: Mr. Jackson's team: A. Shipman (5 Brough), C. Ward (5 Zenith), P. Inman (5 Brough), E. Whaley (24 Levis), and E. Matthews (5-6 Rover sc.).

Mr. J. Stacey's team: F. C. Wates Triumph) and N. Scaife (4 Coven Eagle). Mr. Roper's team: W. Kan hem (6 A.J.S. sc.). Mr. W. Jam nem (b A.J.S. Sc.). Mr. W. Sunbaam), reletcher (2½ Elite), and B. Taylor Elite), Mr. Bradbury's team: Bradbury (4 Norton sc.), B. Williams Norton), R. Denby (4 Norton sc.), W. Steele (4 Norton).

Second Time Round.

Slight showers fell during the f circuit, but a strong wind arose and surface rapidly improved. Those completed the first round mostly impro their running on the second, and the c two to fall out were S. Fletcher (6 -A .. second retirement from Mr. Roper's the and A. Blake (8 Morgan).

On the third round the survivors car on, and no more retired. The finisl in each team are given below, and Roper's team carries off the aw having four finishers and the grea mileage to its credit. G. Wilkin Wilkin] made a remarkable perform in being the only rider of a small mach to complete the course.

Provisional Results. THE SHEFFIELD TRADERS' TROPHY

THE SHEFFIELD TRADERS' TROPHY
First: Mr. F. B. Roper's team. Finishers
Wilkin (2^M₂ Wilkin), F. B. Roper (7-9 Indian
A. Budd (3^M₂ Scott), and F. Ashby (3^M₂ Scot
Second: Mr. J. A. Stacey's team. Finishers
R. Stacey (7-9 Harley-Davidson, sc.), R. K.
(4 Harley-Davidson), E. Searle' (4 Triumph
and S. Rayes (8 Enfeld sc.), Finishers

Fifth: Mr. Jackson's team, Finisher: J.
(8 Acme sc.).

NEW BRITISH MAGNETO.

The Imp-a Single-cylinder Magneto at a Low Price produced by a Well-known Engineering Firm. place it on the market for single-cylinder motor cycles, and it forms an important addition to the range of British magnetos.

It is a quantity production proposition, the design being such that it permits it

to be placed on the market at the com-

A LTHOUGH the Imp magneto illus-A trated is new to the motor cycle world, it has been made in large numbers by Messrs. Petters, Ltd., of Yeovil, for some time past for service in connection with their small lighting sets. It has now been decided, however, to

paratively low price of £4 for single magnetos. Conventional practice is followed practically throughout with the exception of the make-and-break, which is of the face cam type, in which four light flat springs are used. The contact breaker cover is an aluminium casting, held in position by two spring balls engaging in a groove, and while the ignition point is adjustable, means are not provided to make the variation controllable by the rider while

under way.

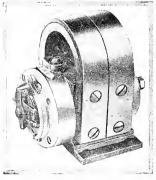

The body is a die casting of aluminium, the magnets are of the best tungsten steel, and the armature runs on ball bearings, the condenser being embodied in the armature end plate. Embedded in ebony insulations with wide cheeks, the slip ring is provided with the usual safety spark gap and the pick-up ter-minal screws into the base, the insulating terminal, which slips on to the high tension terminal, being waterproof and dustproof.

Before being placed on the market, we understand this magneto successfully passed a searching test by the National Physical Laboratory, which body reported

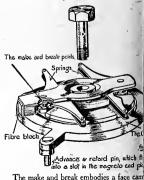

that it was a highly efficient mach For motor cycles, scooters, and of small powered single-cylinder engines, quiring an anti-clockwise magneto, Imp should fill all requirements, especi

In an individual and in the price can be regarded as very 1. Its dimensions are 3\frac{3}{4} \times 2\frac{1}{4} in. beight, and 5\frac{1}{4} in. width over and its weight 6 lb.

The sales office of Messrs. Ltd., are located at 117 to 123, G. Portland Street, W.1.

A new magneto to sell at a popular price -the Imp, manufactured by Petters, Ltd., of Yeovil.

Redstone Rig the Venue of Hill-climb.

One of the New Hills in the Scottish Six Days Trials used by Edinburgh Club Last Week.

THE Edinburgh opening hill-climb, on the new Scottish Trials hill, Redstone Rig, was not all that might be sired for a hill-climb on account of the eacherous nature of its corners. The mface for the most part is good, opening, ith a straight steady pull of 1 in 12 for 0 yards, and terminating like most tottish hills with two bad corners and gradient which stiffens up to about in 6.

Fine Performances.

Undoubtedly, the star performers were and Duncan (Norton) and Russell yack (Bat). Duncan not only put up stest single-cylinder time of the day, it also made lastest time in each of the solo events in which he competed. File riding a three-speed Norton he was stest in the 395 to 600 sidecar handicap. Russell Boyack's cornering was marvels, and he put up fastest time of the y. Among the lightweights James exander, riding a 22 Douglas, did well, tile A. Alexander (7-9 eight-valvedian) put up some impressive performes in the heavier classes. O. G. Braid to an R. J. Braid (32 Moto-coche) also did well among the heavy lecars.

Rodger Macrae, on a 7-9 Harley, was rhaps the most distinguished rider, ough it must be admitted that the ueral standard of riding was excellent, and in all the classes there was a very narrow margin between the competitors. A large number of spectators were present, and the weather favoured the event, which attracted over eighty entrants.

At the start of the Edinburgh M.C. hill-climb on Redstone Rig. The machine in the foreground is a 3½ h.p. Motosacoche

Speed Hill-climbing in Italy

HILL-CLIMB at Monte Vecchia, organised by the Sport Club Milan, took place in April, and, in spite heavy rain, the various classes were dy contested. The course, starting

from Cernnsco, was five kilometres (three miles approximately) in length, and the gradient is 1 in 5 in places, with very bad corners. A $\frac{31}{2}$ h.p. Sunbeam made fastest time of the day.

Gilera (500 c.c. Gilera) rounding one of the bends in the Italian Monte Vecchia hill-climb.

A NOVICES' TRIAL.

A VERY interesting collection of machines gathered at Whitley Common Saturday last for the start of the Novices' trial of the Coventry and Warwickshire M.C. Amongst these were two A.B.C.'s, 8 h.p. Rudge, 2½ h.p. Wilkin, a Francis-Barnett, Henderson, F.N., and Coventry Challenge. A thirty-mile set speed run through Dunchurch, Southam, Fenny Compton, and Avon Dassett provided plenty of interest, and led to the foot of Edge Hill, where a slow hill-climb was held. This club was most amusing from a spectator's point of view, but we should imagine, from sights and smells, that it proved rather expensive in clutch material. The climbs were so slow that it became a matter of balance rather than power, though a few failed through misjudging the gradient. The winners proved to he J. Swindlehurst (Lea-Francis) and S. Allen (5-6 Rover sc.)

3½ h.p. Machines Do Well on Kop Hill.

Successful Event organised by the Ealing M.C.C.

THREE and a half horse-power machines secured eight places out of nine in the solo classes at last Saturday's hill-climb on Kop Hill. This event was organised by the Ealing and District M.C.C., and a splendid afternoon's sport it proved to be. The new 3½ h.p. Duzmo machines and 3½ h.p. Nortons put up some very good performances, and were placed first, second, and third in the 550 c.c. class, first and third in the event for 750 c.c. machines, and first, second, and third in the 1,000 c.c. class. S. P. Brown's 2¾ h.p. Douglas also made a fast climb. The results were as follow: as follow:

	CLASS A (up to 550 c.c.		secs.	
2.	H. le Vack (3½ Duzmo) B. R. Bennett (3½ Norton) J. Wallace (3½ Duzmo)		40} 42g 44

MOTOR (YCLE

N.M.C.F.U. (Coventry).

Starting from Swan Lane, Gosford Green, at 7.30 p.m. on the 11th inst., an evening run will be held in the form of a paperchase,

N.M.C.F.U. (Rotherham).

Several events have been arranged Several events have been arranged for this month, including a run to Matlock Bath on the 9th, and a special meeting on the 14th. This meeting will be at the Y.M.C.A. at 7.30 p.m., and all motor cyclists are invited to attend.

Winchester and District M.C.C.

At a general meeting held recently it At a general meeting held recently it was decided to restart the above club, with Mr. C. E. Godwin as president. The opening run will take place on the 15th inst from headquarters, "The Black Swan," Winchester. Affiliation with the A.C.U. is to be renewed; the hone see, is Mr. G. S. Tungate, 5, St. Cross Road, Winchester.

Sheffield and Hallamshire M.C.C.

Sheffield and Hallamshire M.C.C.
Two competitors, S. Raynes (6 A.J.S. sc.) and J. Best (6 Rover sc.), tied for first place in the Stacey Trophy Trial. Other successful members were: Gold medal, D. Keye (4 Triumph); silver medal, J. C. Wates (4 Triumph); bronze medals, E. Sneath (2½ Wilkin) and W. Vessey (3½ Ariel). Sneath also won the lightweight award, and the two winners divided the sidecar prize.

Neath M.C.C.

The results of the joint club speed trials, held at Margam Park on the 24th trials, held at Margam Park on the 24th ult., were as follow: Class 250 c.c.: S. R. Horsell (2½ New Hudson), 53\frac{4}{5}\$. Class 350 c.c.: W. Edwards (2½ Verus), 47s. Class 500 c.c.: Dr. A. Lindsay (3½ Norton), 33\frac{2}{5}\$. Class 750 c.c.: Dr. A. Lindsay (3½ Norton), 33\frac{2}{5}\$. Class 750 c.c.: Dr. A. Lindsay (3½ Norton), 33\frac{4}{5}\$. Class 1,000 c.c.: Dr. A. Lindsay (3½ Norton), 33\frac{4}{5}\$. Class 750 c.c. sidecar: J. Thomas (3½ Norton sc.), 45s. Class 1,000 c.c. sidecar: J. Thomas (3½ Norton sc.), 43\frac{4}{5}\$.

Mansfield and District M.C.C.

Interest was added to the social run interest was added to the social run held recently by the inclusion of im-promptu hill-climbing en route. On reaching Matlock members tried their machines up Bank Road. G. Mills (5 Matchless) and E. Chandler (7-9 D.M.C.) made good ascents. Later on Monsal Dale was tackled, when again the big D.M.C. showed up well. R. Liake (3½ Lincoln Elk), J. Shaw (2¾ Villiers), and C. Spearing (4½ L.M.C.) also climbed

Westmorland M.C.C.

Brigsteer Scar hill presented a very animated scene on the occasion of the hill-climb held by the club last Thursday. The course was half a mile in length, including two S bends, and had a very bad surface. As might be expected, several competitors came to grief pected, several competitors came to grier in trying to cut the corners too closely. The results were as follow: Class 1 (350 c.c.), M. Sedgwick (23 Douglas). Class 2 (550 c.c.), L. S. Parker (3 A.B.C.). Class 3 (soler 550 c.c.), A. J. Moffatt (4 Norton). Class 4 (sidecars), B. Jeffrey (4 Norton sc.). In the 100 mile reliability trial for the Onice Corn beddens. trial for the Quirk Cup, held on the 24th ult., A. J. Moffatt proved the winner, with E. Wood second, and W. Westwood third.

Marlow and District M.C.C.

At a recent general meeting the following officers were elected: President, Mr. G. C. Bailey; vice-president, Mr. J. P. Hodgson; hon. treasurer, Mr. R. G. Bailey; and hon. sec., Mr. A. F. H. Baldry, Marlow Common, Bucks.

Northern M.C.

This club's recent driving contest over a very tricky half-mile proved a great success. Mr. Brooks (Coulson B), after tieing with Mr Ellis, finally won by reducing his variation to see., and was awarded the Binks carburetter, kindly presented to the club by the makers.

Newcastle and District M.C.

Meetings are being held weekly by the club at the Grand Hotel, during which discussions on various motor cycling topics are particularly interesting to members. The club has already 150 members, and an excellent programme has been drawn np. The hon, sec. is Mr. A. Allison, c/o British Motor Trading Corporation, Ltd., St. James's Street, Newcastle.

Eli Clarke, jun., is evidently following in his father's footsteps, for he won a silver medal in the Bristol M.C.C. Trial to Torquay and back on the 24th of April. His mount was the 4 h.p. Douglas.

Darlington B. and M.C.

At a meeting held by the Motor Cycle Board of the N.E.A.A. at Newcastle the above club was awarded the Grimshaw shield, having had the largest percentage of paid-up members at the Easter Richmond meet.

Manchester M.C.

The results of the speed trial on the 2nd inst. were as follow: Class I.—1, O. E. Carter; 2, G. Cowley. Class 2.—1, E. Bottonley; 2, N. B. Newton. Class 5.—1, E. Bottonley; 2, O. E. Carter. Class 4.—1, E. Smith; 2, II. Taylor.

Burton and District M.C.C.

Runs are being arranged for May and June with the Derby, Loughborough, and Notts clubs, and a 100 mile reliability trial is fixed for May 24th. Hon. sec., Mr. A. E. Cook, Outwoods Street, Burton-on-Trent.

Liverpool M.C.

An interesting "old crock" hill-climb was held on the 2nd inst., the machine used being a two-stroke with a small is the period of the state of t

Middlesex M.C.C.

The results of the speed-judging competition held near Hockcliffe on the 25th ult. were as follow: First, E. Brocard (10 Morris), 5 secs. error; second, W. Farmer (4 Triumph), 1 min. 55 secs.; and third, H. Holmes (10 Morgan), 2 min. 10 secs

Southend-on-Sea and District A.C.

The following wire has been sent to local M.P.'s . '250 members of the Southendon-Sea and District A.C. emphatically protest against the proposed iniquitous taxation of automobiles." This example might be followed by other clubs, and would help to stop this proposed tax becoming law.

Worcester and District M.C.C.

A new club has recently been formed in Worcester, and the following officers appointed: President, Mr. T. W. Badgery; chairman, Mr. J. Bladder; hon. treasurer, Mr. B. J. Parks; captain, Mr. Eric Williams, and shon, sec., Mr. J. Howell, 12, The Foregate, Worcester. All motor cyclists in the county are invited to join. East Lancashire M.C.C.

In order that all members may be able to compete, the Jerrard Cup trial will be run both on the 13th and 15th inst. The course selected will be completed six times at 18 m.p.h., with a stop for re-plenishments after the third lap. Further information and entry forms can be obtained from the hon. sec., Mr. G. Guest, 9, Exchange Street, Blackburn

Wath and District M.C.C.

A very successful hill-climb was held on the 1st inst, in conjunction with the Wombwell Club. The venue was Hoober's Stand, near Wentworth, and over fifty entries were received. The results will be announced in due course. The club will hold a speed trial on June 4th, and motor cyclists in the district are invited to communicate with the hon. sec., Mr. W. W. Evers, Wath.

Club News .-

Northants L.C. and M.C.C.

Among the vice-presidents elected at the annual meeting was Mr. C. A. McCurdy, M.P., the Food Controller, who so ably assisted the club last year. The club is in a good position financially, and a good programme is being arranged.

Bridgwater and District M.C. and L.C.C.

On July 31st a reliability trial for the Carver Cup will be run from Bridgwater to Land's End, starting at 7.30 a.m. Further details can be obtained from the hon, sec., Mr. J. W. Hooper, The Oaks, Wembdon, Bridgwater.

North London M.C.C.

The "find your way" competition held recently proved a great success, and was won by Mr. Jelks, while in the impromptu speed-judging competition, held in the afternoon, Mr. Harveyson proved the victor. An unfortunate incident occurred near Trent Park, when Mr. Barrett collided with a motor 'bus, his passenger sustaining slight injuries.

Redditch and District M.C.C.

successful flexibility hill-climb was held at Beoley Hill, Redditch, on the 28th ult., and some remarkable performances were witnessed, especially the solo slow ascent made by J. Dosher (8 Enfield). The results were as follow: Lightweights: 1, C. Johnson (23 Verus). Heavyweights: 1, J. Dosher (& Verus). Heavyweights: 1, J. Dosher (& Enfield). Sidecars: 1, F. Bicknell (& Enfield). Intending members should communicate with the hon. sec., Mr. P. C. English, "Hazelwood," Headless Cross, Redditch.

N.M.C.F.U. (Leeds).

Twenty-six competitors faced starter in the reliability trial for the Mitchell Trophy held on the 25th ult. The course was part of that included in the 1914 Six Days Trial, and proved quite interesting. H. Pattinson (2½ Revere) won the cup and gold medal with full won the cup and gold medal with full marks. Other successful competitors were: R. Horsley (3½ Norton), gold medal; E. Preston (7-9 Harley sc.) and Morfoot (3½ N.U.T.), silver medals; R. W. Pattinson (4 Triumph ec.) and F. Keyworth (3½ P. and M.), brouze medals. A smoking concert has been arranged for the 12th inst. at the "Golden Lion." All motor cyclists and friends are invited.

May 9—Scarborough M. and M.C.C. Joint Run with Harroquic Club.

May 12—Middlesbrough and District M.C.C. Speedjudging Competition.

May 12—Reston and District M.C.C. Run to
Matobara (Run to Mary).

May 12—Plymouth and District M.C. and L.C.C.
Club Run to Mary.

May 13—Ordord M.C. Speed Judging Competition.

May 13—W.M.C.F.U. (Sheffield). Run to Ashfordin-Water. May 13.—Eastern Valley M.C.C. Hill-climb.

Woolwich, Plumstead and District M.C.

The reliability trial for the Mayor of Taunton's cup, held recently in conjunction with the Rochester and District M.C. over a very sporting course, resulted in a win for J. Howland (Matchless sc.), the next two members being O'Brien (Matchless sc.) and W. Lumsden (Matchless sc.). The best Rochester performances were made by Lawrence (Lea-Francis), Jenner (Triumph), and S. White (Levis).

Bristol M.C.C.

A one day trial from Bristol Torquay and back was held on the 24th ult. C. W. Rankin (3½ Sunbeam sc.) made the best performance, with A. W. Dyer (4 Douglas sc.) second, while sixteen other competitors won silver medals, including Mr. Eli Clark and his fourteen-year-old son, both riding 4 h.p. Douglas sidecars. Young Clark has only recently learnt to ride. F. G. Mann (4 Douglas sc.) won the novice prize.

Surrey M.C.C.

At the members' hill-climb, held at Blagdon Hill on the 24th ult., the following members proved successful in the lowing members proved successful in the various classes: Classe I. (350 c.c.), R. Robinson (Levis). Classes II. and III. (over 350 c.c.), H. C. Mansell (Rover). Class IV. (unlimited on formula), T. G. Meeten (Rudge). Class V. (stopping and restarting), F. J. Disney (Triumph). Class VI. (unlimited on time), T. G. Meeten (Rudge). Class VII. (sidecers on formula), A. Robins (Blackburne).

Ilkley M.C. and L.C.C.

Two competitions, a hill-climb and speed trial, were held on the 25th ult. The former event, in which members competed for the Dawson Trophy, was won by W. S. Crothers (3½ Triumph sc.), with R. W. Stanfield (3½ Scott) second, and J. S. Duxbury (3½ Scott) third, while in the speed trial for the trade trophy, G. Brook (3½ Teiumph) proved the winner, J. Stanfield (2½ Douglas) second, and J. Midgley (2½ Douglas) third.

Burnley and District M.C.C.

Fifteen classes were included in the recent members hill-climb held at Thornyholme Hill, and with a good entry, the event proved a great success. The best event proved a great success. The performances were as follow: Fast: performances were as follow: Fast: 1, 270 c.c., G. Swinglehurst (Levis); II, 350 c.c., B. Houlding (Douglas); III, 600 c.c., B. Houlding (Douglas); IV, 800 c.c., H. Armstrong (A.B.C.); V. unlimited, S. A. Marks (Harley); V1I, sidecar over 600 c.c., B. Houlding (Harley sc.). Slow: V1II, 600 c.c., W. H. Greenway (Triumph); IX, H. Armstrong (A.B.C.); XI, over 600 c.c., sidecar, J. Collison (Ariel sc.). Acceleration: XII, 600 c.c., J. R. Ashworth (Sunbeam); XIII. H. Armstrong (A.B.C.); XV. J. XIII. H. Armstrong (A.B.C.); XV. J. XIII, H. Armstrong (A.B.C.); XV, J. Collison (Ariel sc.).

*HESE soles are real money savers. The extraordinary prices which are now ruling in footwear and repairs is a mat ter of greatest importance. Those who have tried Ustikon Soles know too well the economy they have effected They are simplicity itself. No apparatus is required and no damage what ever is done to the boots. These soles are stuck with Sol-fix rendering boots absolutely water proof. WE GUARANTEE THEM TO HOLD AS FIRMLYAS RIVETS OR SEWING and by fitting, you will accomplish an appreciable economy.

Twin, Bosch mag., Enfield 2-speed, F.E., head lamp, tools, new covers, ride away; £50.—Shepherd, Hillside, Frimley, Surrey. [8406]

A PRESS OPINION.

From "The Irish Cyclist and Motor Cyclist,"
March 17th, 1920.

"There are not many machines finished in Colour nowadays and the few that are come from new comers to the Motor Cycle World. There are exceptions of course.

The IVY is one, and a real smart machine it looks, too, in its khaki and black finish. All-the same I doubt whether its colour has anything to do with its popularity,

It is one of the finest two-strokes made, and if it were painted sunrise pink, it would sell, because its owners talk and spread the good news."

In the Colmore Cup Trial, IVY'S obtained a first and second class Certificate.

The best Hook

Fastener"

General Military Hospital.

Colchester,

14/4/20.

Dear Sir

I used the Forward hook fasteners throughout the London-Land's End Trial, and found them in every way reliable. They gave me no trouble at all, and assisted me to no small extent in getting a gold medal.

It certainly is the best hook fastener I have used.

Yours truly,

The FORWARD Sparking Plug Co., Summer Row. BIRMINGHAM.

BAMCO Sidecars,—Specialists in cars for Scott, Triumph, B.S.A., Sunbeam, Douglas, etc.

BAMCO Sidecars.—We are now booking orders for American outfits, Harley-Davidson, Reading-Standard, American Excelsior, Henderson, etc.; prompt delivery can be given at present.

BAMCO Sidecars.—We have a limited number of cass suitable for Triumph, B.S.A., etc., ready for immediate-delivery, but prompt application is admirable.

B.A.M. Co., Ltd., address as above. T. d.n. 872. T.A.; Ibbireraf, Willgreen. Tel.; Wille

NOTHING, nothing, and what is the reason why, when one gets to the end of life there's nothing to do but die.

NOTHING. Ves, its a lact; mind you don't die prematurely, that's all.

NOTHING will help an inadvertent suicide more than a wretchedly made sidecar.

NOTHING'S worse than the feeling caused by trac-tion engines passing over one's dining room, whether tight laced or not. In fact, 'tis sometimes

NOTHING is spared in expense or trouble to produce the best chassis possible at Middleton's.

NOTHING we require in exchange for the finest sidecar made except the dough, the old dough, and nothing but the dough.

and nothing hut the dough.

NOTHING too troublesome Special department for Inssy individuals. Gent walks in, wants sideen; Note of the state of the

NOTHING worse than amateurs attempting advertisement writing. It's not in my line, I'm the plumber. Shakespeare excuse us quoting the barred, the lact is we are Middleton's

L ONDON'S oldest established sidecar makers.

\mathbf{IF} **SAXONS** Were Alive.

If Saxon Spring Forks were alive-if they could speak-they would tell you that the present condition of the roads was their businessnot yours.

Decidedly pre-eminent in their shock absorbing qualities, they reduce to an absolute minimum all vibration and rough road shocks.

Get friendly with the Saxon, and ride rough roads in comfort. Sand postcard to-day for full particulars,

S. R. RIDGWAY, Digbeth, BIRMINGHAM.

Premium Hunting.

N our correspondence columns this week, we publish a letter from the president of the British Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., drawing attention to the practice of "pseudo dealers," who take advantage of the present abnormal conditions to obtain premiums on new machines. Abnormal times always bring in their train undesirable conditions, and, while supply and demand are so far apart, much as it is to be deplored, present-day practices will prevail. So far as motor cycles are concerned, the purchaser who deals with the only appointed agent of the manufacturer is secure from the premium hunter, who generally is a "private purchaser" who has had the foresight to order early in order to resell at a premium to his fellows not so fortunate, and—to be perfectly candid—less enterprising. The remedy is in the hands of the genuine riding public. long as there are buyers ready to pay a premium, there will always be people to sell. The suggestion of the makers to withdraw guarantees from machines resold within a reasonable period is a good one, although it probably will have little effect, as the men who are ready to pay heavy premiums are those who rarely need to ask that the terms of the guarantee be fulfilled. the same, it is highly desirable that the manufacturers and their agents should do something

to alter the present position.

Most agents sell only at catalogue prices, and any general departure from this good rule may alter the whole foundation of their future business. At the present time there are excellent relations between the purchaser and his agent on the one hand and the agent and the manufacturer on the other.

Only increased production, a levelling up of supply and demand, can eliminate the psuedo dealer and premium hunter. There are signs that a more normal state of affairs is nearer than many suppose. Twelve months ago premiums

were paid on pedal bicycles, to-day the supply is greater than the demand; the purchaser can pick and choose and obtain what he desires at the catalogue price. In the lightweight motor cycle field the supply is almost level with demand, and the position regarding sidecar machines is becoming easier every week. Increased production is the only cure for present high prices, and this holds good in the motor cycle world just as it does elsewhere.

"The Motor Cycle"-41d.

ITH this issue, the price of The Motor Cycle is raised to 41/2d. The increase is mainly due to the very marked advance in the cost of paper. January 1st last, the price of paper has risen 2d, per pound, which represents an increase of over £35,000 in the annual paper bill of The Motor Cycle. Quite apart from the cost of printing and editing the journal, the paper used in each copy to-day costs over 334d. as compared to three farthings in prewar days. Add to this the general production and distribution charges, it will be apparent that the 41/2d. now charged does not cover the whole of the increased cost. Even at the new price of 41/2d., we shall still receive (after taking trade terms to newsagents into consideration) nearly rd. per copy less than the cost of the raw paper The popularity and wide circulation of this journal only complicate the position. Notwithstanding the increase, the journal will not bear a commercial profit, but, as we hope that the present high cost of paper is only temporary, we are content that this should be so. Readers, advertisers, and proprietors must all bear a portion of the increased cost, and we are sure that the step we have taken will be preferred to a curtailment of size or quality of the editorial matter. We sincerely hope that conditions will at a later date permit of a reduction in price, but, frankly, there are no prospects of any downward movement at the present time.

No Finality Yet.

THOSE jaundiced critics who thought at Olympia that our industry had got into a rut would rub their eyes when they saw the drawings of the new Pullin two-stroke; and behind the scenes there are other novelties still in the experimental stage. Frame, price, ignition, carburation, gear box, engine cycle, brake work, lighting—every solitary item, if not absolutely new, is instinct with elements of novelty. Even the silencer, contrary to the general run of two-strokes, contains two separate baffle plates, and all two-stroke enthusiasts will be anxious to hear the machine on the road, for an engine of this type, which claims to be practically immune from four-stroking and able to tone down the exuberance of its exhaust gases, has distinct attractions.

Nerves and Grease.

AST week I covered a particularly nasty piece of road six separate times, and on each occasion it was disgustingly greasy. Twice I rode it in daylight with a vertical breeze up, hating every yard of the way. Twice I covered it at night with rather an inefficient acetylene lamp, and my attention was so occupied with peering ahead that I completely forgot to be afraid of side-slip, except when the short-range lighting compelled me to watch the road too close to my front wheel, and the short-focus steering, as always, proved unsteady and set up a mild skid or two. Twice I rode it with excellent lamps, and, since my gaze was concentrated far enough ahead for me to steer steadily, and too far ahead for me to note the details of the road surface, I completed these two trips without fear and tail-wagging. It only shows that skidding is more a matter of nerves than of tyres, balance, or surface.

A Glorious Scrap.

MY week-end was enjoyed with the aid of a T.T. Norton. The main reflection which it inspired was that nobody can name a speed which in itself is dangerous. Given perfect steering, perfect brakes, and an engine which is game to push you along at anything between 5 m.p.h. and 65 m.p.h. on top gear, all questions of risk attach to the rider rather than to the speed of the machine. This 'bus can safely be driven over wet roads at an average figure which the correspondents of the daily papers "Paterfamilias," "Commonsense," and other gentlemen of that kidney, would consider formidable on Brooklands. If there is a fiercer 3½ h.p. than the Norton speed model, I should like to meet it; and yet it can amble along without pinking, like a mediaval abbot's palfrey.

Perhaps the sweetest thing about a very charming 'bus is the greedy way in which it can gobble up really steep hills on top. You must give it a rush, of course if you do not want the advanced ignition to breed a hammering; and, if there are bends ahead, you must be prepared to lie well-over. But set it at the straighter climbs of the Dashwood variety, and the speed it can register up 1 in 10 and worse is literally phenomenal.

Air Stranglers.

JILL somebody tell me why so many American makers fit shutters to the air intakes of their carbutetters, and yet the fitting remains a rare exception on carburetters of British manufacture? am lumping cars and cycles together in this statement bien entendu. During the last year or two I have had to grapple with the not uncommon combination of bac fuel and a cold garage in connection with every con ceivable type of petrol engine; and I have invariably found that an improvised air strangler ensured a firs time start with them all, if we except very multi cylinder aircraft engines, which often require rathe. special treatment. It is, of course, a fairly simple job for an amateur mechanic to rig up an air shutter, ever for a motor cycle engine, which demands a screen filter as well as a shutter, to prevent the sand-blasting effect of drawing grit-laden air past the valve. When I lack time to make a proper engineering fitting; I am driven to unscrew the gauze screen, insert a cork start up, withdraw the cork, and replace the gauze I fancy there would be a goodish sale for a blank spring-held cap to fit over the gauze of standard carburetters. Purchasers could drill air holes to suithemselves. Is the trade afraid that duffers will such pints of neat petrol into their engines, and scour the oil off the cylinder walls? Or why is so handy a fitting still so scarce? A colleague suggests that an adjacem exhaust pipe may be the cause of this hesitation, but I do not see that the universal habit of flooding is much less risky in such cases.

Fly-up Stands.

EADERS must be growing tired of this cross heading. Is there, or is there not, an undodgable master patent on fly-up stands? In this year of grace I have paid well over £100 for a comparatively low-powered solo mount. It chances to possess no substantial protrusion by which it can be propped against a kerb, and its bows bristle with so many fragile projections that it is not wise to lear the 'bus against a wall. Whenever I stop, wisdom suggests lowering the stand. It is not difficult to drop

Occasional Comments .--

the stand, but it is a filthy and laborious job to get it up again when I wish to proceed. When up, it stops up, which is more than can be said for many stands even in 1920. But to raise it I must compress the tail of the back mudguard with both thumbs, and use all the force my twin forefingers can exert to squeeze the stand past the guard. This part of

the machine is always filthy; naturally collects plenty of mud, and the fish-tailed exhaust pipe squirts a film of oil blobs over the neighbourhood. If I raise the stand with bare hands, I need a paraffin bath; if I first put on gloveswell, my dry-weather gloves cost two guineas, and my wet-weather gloves are a thirty shilling pair of irreplaceable Hun rubbers. How I sigh for my old Rudge, which automatically tucked up its own tail whenever you wheeled the 'bus forward!

A Good Compression Tap. NINDING that nobody seems able to start a Scott from cold on one kick without petrol injections, I am fitting compression taps to my engine, as a squirt of dope ensures an instant start, just as it generally does with four-stroke engines. Some Scotts are fitted with pipes

coupling the drain-cock of the petrol

tank to the inlet pipe; but I dislike

small screwed unions in inlet pipes. Presumably the Scott people refrain from fitting compression cocks, because air leaks are specially fatal to good running, and a twostroke already possesses sufficient possibilities of leakage without going out of one's way to add to them. But the Scott cylinder heads are fitted with screwed plugs of ordinary-s.p. thread, and Ripaults market an excellent compression tap of the right reach and thread. Its special merits are that it has a taper

seating to guard the compression, a priming hole which is shielded from carbon when the tap is shut, and an ebonite finger piece, which does not burn the fingers or break off after the manner of the ordinary brass tap handle. Let it be added that nobody can complain of the Scott starting: we must expect half a dozen kicks when a crank case requires charging with mixture as well as a cylinder. But the magnificent

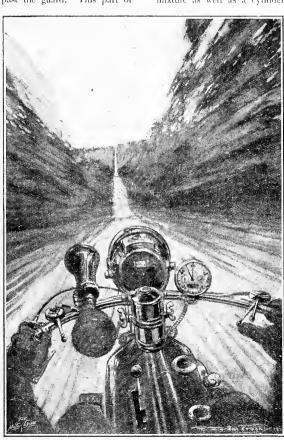

Scott steering and springing tempt me to use it for business purposes.
"Business" the other afternoon spelt six calls in three hours, each long enough to chill the radiator completely. The -original cold start, plus six stops on the road, made a total of seven cold starts in three hours. i.e., some forty-two digs at the starter. That is why I am fitting the Ripault

A Rocksteady Speedometer.

BOUT Armistice Day I heard rumours that a certain instrument merchant, ex R.A.F., was shortly to produce a new speedometer, positively accurate, with a dial no bigger than an Ingersoll, and selling at ten shillings or thereabouts. As this miracle has not vet materialised, I fitted a Bonniksen to my Scott, and am simply charmed with it. Not only is its drive dead silent, but its needles are rocksteady, and. what is still more instructive, it has taught me that all my previous speedo-

meters were untruthful. The standard Scott does not lay itself out for excessive speed, but the Bonniksen's record of its paces was always some 10 m.p.h. below my own estimates, and at last I got nettled, and made careful tests. There is no question that the Bonniksen is accurate, and I am driven to conclude that the instruments which I have previously used exaggerated the actual speed rather markedly at speeds in excess of 30 m.p.h.

THE OPEN ROAD. What fascination there is in watching the road_aheadespecially if it be a route with which one is not acquainted? To reach the horizon, to guess what lies beyond is a never-ending source of pleasure. On a road such as is depicted, the motor cyclist enjoys an exhilaration unknown to the rest of his fellows.

Duplex Frames,-

Scott.

Of all those duplex frames at present before the public, the Scott has been longest on the market, and is an exception which proves the rule that flat twins and duplex frames are generally found together. This frame is designed from end to end upon scientific principles. It is triangulated, and radiates from the

engine as a centre, upwards to the head, and backwards to the rear hub and seat pillar; thus it needs no top tube, as usually seen, to complete its rigidity. It is duplex throughout, with the exception of the seat pillar tube, which is surrounded by the tank, the head, and the tube, which passes above the engine. The frame is complete in itself, and, although the engine stiffens it.

when in position, it does not form a frame member, but rather a frame centre.

Indian Scout.

In this machine twin tubes extend from the head to the rear These run side by side until they pass the lug to which the lower tank tube is attached; they then separate sharply to the point where they take a turn to the rear, whence they run nearly parallel on each side of the

engine and gear box to the rear hub. The least attractive part of this design lies in the method of fitting the tube from the saddle to the lower part of the frame.

The Cotton.

The frame designed by Mr. Willoughby Cotton is duplex to a large degree, as well as triangular throughout. Two pairs of duplex tubes extend from the head to the rear axle, and the tank is mounted between

them. Another pair of tubes are placed between the rear axle and the lower part of the engine, while a fourth pair connect the rear axle with the gear box. Thus it will be seen that the rear wheel is most rigidly fixed, having no fewer than four tubes on each side of it-double the usual number. The single tubes in this machine are those which extend to the engine from the saddle and the steering head.

Partly Duplex Frames.

The Velocette makes no pretence to a duplex frame throughout, but the down tube is double, and extends below the engine to the gear box: a very sound combination of a duplex and loop frame. The Diamond also has a duplex down tube, which is detachable: .: but in this case does not extend below the engine, but is attached to an engine plate of The Cotton duplex and triangulated frame. the usual design. In the Ivy design the front down tubes are duplex, and the bar below the

flat metal instead. of the usual tube. The 4 h.p. Douglas has a down tube which divides at a lug below the tank, and straddles the front cylinder. The Henderson four-cylinder machine has a frame which is slightly less duplex than the corresponding F.N., and another peculiarity

tank consists of a piece of

is that there is no down tube from the seat. Many flat twins are mounted on double tubes where the duplex principle is not carried any further. The Wooler, Humber, and 23 h.p. Douglas are examples of this method of construction.

Notes on Motor Cycle Legislation.

The Anomalous Position of the Motor Cyclist. What is a Motor Cycle?

CAR in the future may have two 7in, head lamps of 24 c.p. each. A motor cycle one 5in. lamp of 12 c.p. Such are the recommendations of the Parliamentary Committee on Lights on Vehicles.

According to the law, a motor cycle is a vehicle under 7 cwt. on three wheels. A tricycle with an Auto-wheel attached is a car.

If the above two anomalies are not altered we may see an old tricycle with a motor wheel sporting two great head

lights and subject to a tax of £6.

Surely a motor cycle is any form of motor vehicle under a certain weight?

Many motor cyclists only use their machines for the best six months of the year, but the suggestion to give them the option of quarterly payments was "turned down" because the sums were so small.

Unless motor cyclists are given this option quite a number will give up riding, with the result that the Treasury wills obtain nothing. Half a loaf is better than no bread.

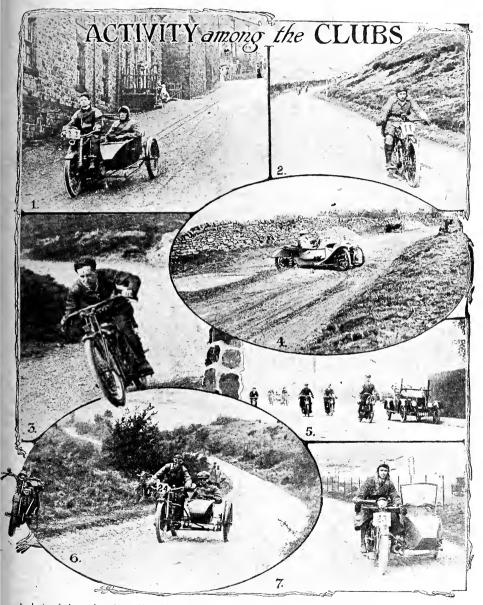

The proposed taxation may help develop the real light-weight motor cycle so long urged by The Motor Cycle.

But it will also retard development of the light four-wheeler of which there are several promising designs.

There are some three-wheelers which are cars on three wheels, and there are some four-wheelers that are nothing more than motor cycles.

A tax that influences design is a tax on progress, and retards development in directions other than those suited to the taxation basis.

All modern cars have long-stroke engines, because the Treasury rating takes only bore into account.

A NEW DE LUXE "SINGLE."

The Wilkin 4 h p. Model—a Sheffield Production of Attractive Design.

REALLY high - class single - cylinder machines are few and far between among the new comers to the market, and for this reason the Wilkin 4 h.p. machine will attract its full share of attention. It is the product of Mr. G. W. Wilkin, of Sheffield, who for several years has been selling motor cycles besides riding them both privately and in competitions.

In deciding to market a machine under his own name, Mr. Wilkin very wisely refrained from taking the line of least resistance by merely assembling standard units in a standard frame. True, the engine, gear, and forks are standard units, but he has succeeded in making a most distinctive machine by the manner in which he has used them in the attractive frame of his own design.

The engine is the well-known Black-burne "4," and the gear hox a Sturmey-Archer with all chain transmission totally enclosed in well-proportioned cases.

Having a sloping top tube, the frame has distinctive lines, and is rather longer than would have been necessary on a machine intended for solo work.

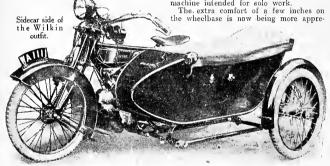

ciated by designers, but in the Wilkin this is not carried to a degree to make the machine ungainly in appearance. As will be seen from the Illustrations, the Lucas Magdyno combined lighting and ignition set forms part of the equipment, and the black finish is relieved by neat gold lining on the tank and a plated handle-bar.

The mudguards are of good width, and in the case of the front wheel guards extend ontside the fork members, while the valances on both are deep.

At every point the design and construc At every point the design and construc-tion appear to be sound, and we should not be surprised to see the Wilkin become very popular, not only in the districts adjacent to its birthplace, but among motor cyclists generally. We congratulate Mr. Wilkin on a splendid machine, which comes as a welcome addition to a type of which there are not too many representatives.

A three-wheeler of an exceptionally

A SIDECAR ALTERNATIVE.

HERE are certain ex-motor cyclists who believe that the present day de luxe sidecar will eventually be replaced by a form of three-wheeler providing protected accommodation for the driver. The illustration depicts what may be termed a redesigned sidecar may be termed a recessioned succar outfit, and although the bodywork apparently errs on the side of elaboration, the mechanics follow motor cycle practice. The engine is an air-cooled 8 h.p. Jap V twin, the genr box a Sturmey-Archer, and the transmission is by § x §in. chain from engine to gear box, by 1 in. belt from gear box to countershaft beneath the seat and finally by single 3 × 7 in. chain to the driving wheel.

All wheels are readily detachable, and are shod with 700 x 80in. tyres. Enclosed coil springs are used for the front

Car Type Body-Motor Cycle Mechanism. pleasing design.

> suspension and quarter-elliptics at the rear. The steering is direct, and stands are fitted to each wheel.

> Having a wheelbase of 6ft. 9in. and a track of 3ft. 9in., the weight is 6½ cwt., equipped with a four gallon petrol

tank, one gallon oil tank, six volt dynamo lighting set, speedometer, etc. Mr. W. G. Topham, of 17, Poplar Avenue, King's Heath, Birmingham, is the designer, and the machine seems to has a five-taless prediction. be a first-class production.

HINTS TO THE NOVICE.

Notes on Sparking Plug Faults and Others for which the Plug is Often Blamed.

THE modern petrol engine embodies several component parts, each of which is made by a manufacturer who specialises purely in this one part; and, while the manufacturer is responsible for the satisfaction given by his production, the various parts of an engine are so related that a fault in one part often affects one or more of the others. The sparking plug is one such small but vital part, and when misfiring occurs this part is always suspected first. Often when ignition trouble is localised at the plug, and temporarily remedied by fitting a new plug, the cause of the trouble is in some other part of the engine. The cooling, lubrication, carburation, timing of valves, and ignition, can all affect the sparking plug.

The responsibility of the sparking plug maker begins at the terminal of the plug, and ends at the spark

gap: that is to say, the sequence of events that occur before the spark reaches the terminal and after the spark occurs at the gap is quite befond his control.

In setting out the faults that may occur,

in the sparking plug, it is, therefore, assumed that there is a suitable electric pressure of 8,000 volts or so at the sparking plug terminal, and that the spark gap is surrounded with a suitable explosive mixture.

The magneto is responsible for the supply of the electric current or spark to the terminal, and this spark can be tested by disconnecting the high-tension cable

and holding it about \(\frac{1}{16}\) in. away, from the plug terminal or the metal of the engine, while the engine is either running or being turned round at a sufficient speed. The spark should easily be able to jump that distance in air. If no spark is produced, there may be several reasons, but the three most common causes are that the low-tension-insulated terminal of the magneto is "earthed," the rocking arm of the contact breaker is stuck with the contact points apart owing to the fibre bearing swelling, or that there is a fault in the high-tension cable. The timing of the spark is correctly adjusted when, with the ignition lever fully retarded, the spark occurs when the piston is just over the compression dead centre. Advancing the ignition lever will then cause the spark to occur before the piston reaches the full compression position.

Mixture Variations.

The setting of the carburetter which gives the best power at all speeds is the correct setting. As a rule, misfiring indicates too weak a mixture: sooting up of the sparking plug represents too rich a mixture. If the carburetter is producing too weak a mixture, the effect may either be simple misfiring, or may result in firing in the inlet pipe (popping in the carburetter)

caused by the mixture burning slowly and igniting the incoming gas. Too rich a mixture may cause simple misfiring, owing to the deposit of soot over the insulation of the sparking plug, or may cause pre-ignition due to the overheating of the engine and sparking plug. Pre-ignition is caused by some piece of metal or carbon (usually the central electrode of the sparking plug) being red-hot. The most noticeable effect of pre-ignition is to cause "knocking," and occasionally the symptoms are similar to seizure. Both too weak and too rich a mixture cause overheating of the engine.

Assuming, however, that the magneto is supplying a proper spark at the correct moment to the terminal of the sparking plug, and that the carburetter is supplying an ignitable mixture at all speeds, there

remain the various possible faults that may be caused by a faulty sparking plug.

Fig. 1.

Misfiring.

The spark gap may be closed up or joined across by a thin thread of metal, or the spark gap may be too wide for the spark to jump. The correct width of gap is ½ mm., or the thickness of a stout visiting-card. The insulator may be cracked if of the porcélain type, or punctured if of the mica type; the spark then jumps straight from the insulated centre pin to the metal body of the plug instead of occurring at the spark gap.

The only remedy is new insulation or a new plug. The surface of the insulation at the sparking end of the plug may be covered with soot, caused either by too rich a mixture or by burnt lubricating oil. This is the most common fault, but the plug cannot be blamed for this trouble. When the soot is caused by burnt lubricating oil, it has a rough coarse-grained appearance; when it is caused by too rich a mixture, it has a very fine, smooth appearance. The remedy, of course, lies in improving the lubricating arrangements or the carburetter. Sparking plugs can be designed to continue to fire despite a considerable amount of soot on the insulator, but the more plugs are designed with this point in view, the worse they are as a rule in other respects. Soot on the insulator caused by too rich a mixture is a sign of imperfect combustion, and anybody in charge of a petrol engine should not be satisfied with such a state of affairs. Besides the trouble caused by misfiring, there is a considerable loss of power and waste of petrol. If sooting cannot be cured, the most suitable plug is one with the most open end and longest exposed insulating surface, as shown in fig. 1.

Another cause of misfiring is the use of a poor quality insulator of the porcelain type in a sparking

Hints to the Novice .-

plug, such that when this insulator is heated up it gradually loses its insulating qualities, and allows the spark to leak away. This effect is usually noticed on an air-cooled motor cycle during a long climb, the symptoms being that the firing gradually gets weaker and weaker, and, finally, the engine stops; but it should always be borne in mind that failure of the petrol supply can give very similar symptoms.

Back Firing.

When this is caused by the sparking plug, it is due to the central electrode or the tip of the insulator remaining red-hot when the inlet valve opens. This usually happens with a plug having a long thin central electrode and a long thin insulating sleeve round the central electrode, as indicated in fig. 1. The remedy is to use a plug having a thicker central electrode and a shorter insulating sleeve, or the type of insulator called the solid-ended, as indicated in fig. 2; but here again it must be borne in mind that popping in the carburetter is much more often caused by the mixture being too weak. The petrol supply may be exhausted, or dirt or water may be choking the carburetter jet, or there may be a bad air leak into the combustion chamber. Another cause is the setting of

the ignition timing too late for the speed of the engine.

Pre-ignition.

If heat continues to be supplied to the sparking plug faster than the plug can get rid of it, at a certain stage a temperature will be reached when the central electrode of the sparking plug will be at a dull red heat during the compression stroke. The mixture will be fired by this red-hot metal, and the engine will knock badly. The remedy is either to reduce the load on the engine, and so supply less heat to the plug or else to fit a better design of sparking plug.

It is difficult to describe briefly the kind of plug that is required, but the chief feature is a thick centre pin. Anything in the nature of a thin diameter centre pin with a large metal surface at the sparking end usually causes pre-ignition. The type of plug indicated in fig. 1, if it does not cause back-firing, may cause pre-ignition, whereas the type of plug shown in fig. 2 will certainly not cause back-firing, and will only cause pre-ignition on a very hot engine. In the case of pre-ignition, it should always be remembered that the engine may be getting excessively hot, due to faulty carburation or, of course, insufficient cooling. Pre-ignition can also occur by the ignition timing being advanced too far for the speed of the engine.

The Late Mr. A. W. Torkington.

Well-known Personality in the Trade, N.M.C.F.U. and A.C.U.

A S recorded in the major portion of our last week's issue, the death of Mr. A. W. Torkington comes as a severe shock to those motor cyclists who, even though they did not know him personally, knew of him and his excellent work for the movement. Those who knew him well were aware that he was suffering from a serious complaint, which was bound sooner or later to terminate fatally, but the end came very suddenly on the 3rd inst.

Mr. Torkington took an interest in automobile matters from the very early days. He was associated with a tyre which bore his name, and later with the Stelastic tyre which was by no means unknown among

motor cyclists.

It was in 1912, however, that he first took an active part in motor cycle matters, as it was in that year that he joined the committee of the Auto Cycle Union as a representative of the Royal Automobile Club. In the following year he became treasurer to the Union, and devoted himself most assiduously to the financial side of the organisation, showing remarkable ability in this office until 1919, when, on the death of Mr. J. R. Nisbet, he took over the chairmanship.

It is not only as an official of the Auto Cycle Union that Mr. Torkington's name will be remembered by motor cyclists. He was founder and chairman of the National

Motor Cyclists' Fuel Union, a body organised during the war, which clearly placed before the authorities the

Mr. A. W. 7 orkington at the last Six Days Trial

claims of motor cyclists, especially manual workers, for a small dole of petrol to enable them either to get to their work on their motor cycles or to enjoy a week-end run in the open country. Under the able organisation of Mr. Torkington the National Motor Cyclists' Fuel Union grew and prospered, and many hard workers employed at high pressure on war work during the week in a sometimes stuffy and badly ventilated factory were able to enjoy the delights of the open road on Saturdays and Sundays. Mr. Torkington was well aware of the importance of helping the worker to get ample relaxation, and his devoted efforts certainly bore fruit.

Mr. Torkington not only interested himself in motor cycles but in automobilism as well. He was a member of the Royal Automobile Club Committee, a member of the General Sub-committee, and several other sub-committees, among them the Financial Committee.

He served in the Territorials (R.A.), and held the rank of colonel.

The Auto Cycle Union has been sorely stricken in the loss of two chairmen within but a few months of one another, and the vacant post will be exceedingly hard to fill. The late Mr. Torkington had the welfare of motor cyclists always at heart, and he will be greatly missed by all those who knew him. The funeral took place at noon

on Friday last at the Paddington Cemetery, the service being taken by the Rev. E. P. Greenhill. candle lantern.

Ballard's camp-

ing outfit stowed

burne sidecar.

Compact Equipment for the Open-air Life. M UCH enjoyment and a considerable saving of money can be effected by the motor cyclist who carries his house-with him, and is thus independent of botels and high hotel charges. Both in this country and in France many pleasant tours at a very small cost can be undertaken

Messrs. Ballard's Motors, 92, Gloncester Road, London, S.W.7, have thoroughly studied the question tion, and have erected in their showrooms a capital (with fly sheet and ground sheet) which will comfortably accommodate two people, and can be supplied with two blankets or one sleeping bag. The equipment consists not only of the tent com-The equipment consists not only of the tent couplete, pegs, and the bag to store it in, but the complete camping outfit, including a Primus stove, kettle, a cantecu, a saucepan, a frying pan, plates, cups, knives and forks, a Thermos flask, a trenching tool (a very useful accessory for camping), and a

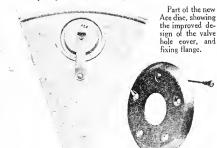

REFINEMENTS IN DISC WHEELS.

A LTHOUGH the Ace disc wheel has established a reputation for its refinements, chief among which being "the flange fixing, eliminating small bolts and nuts, the manufacturers have not been content to rest on their laurels. They have improved both the appearance of the discs (which are now made of aluminiam exclusively) by spinning them in one piece without a joint, and by an improved valye hole joint, and by an improved valve hole cover.

The latter takes the form of a small circular flanged cap fixed to the disc by a flat spring, which holds it in position in the orifice of

the circular valve hole. Another improvement in the Ace disc is the flange, which now a neat stamping recessed to take the special bolts.

Those riders who favour disc wheels (and there is little to be said against their use on sidecar machines at any to be said against their use on sidecar machines at any rate) will undoubtedly find that the Ace discs are as nearly an ideal fitting as it is possible to obtain. The method of fixing renders them quite rattle-proof, and the sizes are planned to be an accurate fit on several standard machines. The makers have now changed the title of the firm from the Disc Engineering Co. to Cornercroft, Ltd., with works at Vecqueray Street, Coventry.

AN EFFECTIVE REAR STAND CLIP.

T is a common spectacle, even in these days, to see trailing motor cycle stands. The average clip is so designed that it either holds the stand so firmly that it requires a great effort to free it, or, on the contrary, allows it to drop immediately bumpy

roads are traversed. Recognising these faults, the Arden Motor Co., Ltd., of Balsall, Berkswell,

A neat rear stand clip.

near Coventry, have produced a new rear stand clip, the Klipitite, which they claim will hold the rear stand up quite firmly, even over the roughest roads.

A glance at the illustration will reveal the fact that the whole clip is simplicity itsel, and that the mechanism, which consists of a strong spring pressing on to a hardened steel ball of ample dimensions, is totally enclosed.

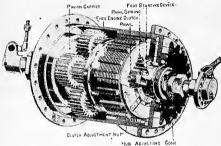

A Popular Handbook for Motor Cyclists.

The Twenty-first Edition of "Motor Cycles and How to Manage Them." Revised and Largely Rewritten.

A LTHOUGH many manufacturers supply very complete instruction booklets with new motor cycles, others do not do so, and often a rider is at a loss to know how he may get the best results from his machine. In the case of second-hand motor cycles also, the novice may purchase a machine with very little knowledge of its management and control, and to riders in such a class, the

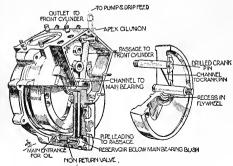

In the case of second-hand motor cycles also, the novice may purchase a machine with very little knowledge of its management and control, and to riders in such a class, the need of a handbook, describing the working and running of a motor cycle, is decidedly real. This need has been filled by the various book publications issued from the offices of The Motor Cycle, chief amongst them being "Motor Cycles and How to Manage Them" (Iliffe and Sons Ltd., 20, Tudor Street, London, E.C.4, price 2s. 6d., by post 2s. 10d.).

A new edition (the 21st) of the latter has recently been prepared, and it is now out of the printers' hands. The revision of the matter and illustrations has been very com-

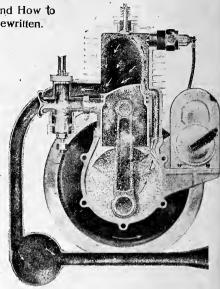

The Armstrong three-speed hub gear fitted to many 1914 machines. An illustration showing a mechanism usually puzzling to the rider.

plete, and much obsolete material deleted. The object of the book is not only to, give the motor cyclist a review of current motor cycle practice, but also to instruct him in obtaining the best results from his machine. Three hundred and fifty illustrations, in both line and half-tone, show not only complete machines, but also the chief components and accessory details. Carefully prepared sectional illustrations are shown of typical engines, gear boxes, and magnetos, and two sets of very clear explanatory diagrams are included, showing respectively the operation of engines of both the four-stroke and two-stroke pattern.

Diagrammatic arrangements of lubrication systems are clearly shown; this illustration is of the J.A.P. twin-cylinder engine

A specimen illustration. The action of two and four stroke engines is explained very fully, and specially prepared diagrams illustrate the complete cycles of operations.

The Magneto Explained.

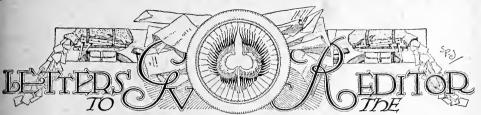

The reliability of the modern magneto is such that a motor cyclist may easily ride throughout the whole season without either understanding or in any way caring for the ignition apparatus. At the same time, however, there are many who desire to understand the working of the magneto in order that they may be able to effect minor adjustments if the need for them ever arises. With this end in view, the chapter devoted to the high-tension magneto has been entirely rewritten, and in clear and simple language it now gives a sound and practical explanation of all that need be known about this very interesting component part of the machine. It may be confidently asserted that no better article on the magneto has ever been published other than in text books particularly devoted to the subject of ignition.

particularly devoted to the subject of ignition. Separate chapters are devoted to multi-cylinder engines, the action of two-strokes, and also to carburation, lubrication, and cooling systems. There is a great deal of information on transmission and gearing, the internal arrangements of most well-known gear boxes heing illustrated. The latest development in spring frames and sidecar construction are also reviewed. Ladies and those who are interested in light openframed motor cycles and machines in the scooter class will find that the most popular models are dealt with. Lighting-equipment, tyres, and speed meters are also discussed in its 275 pages.

Practical Instruction.

In addition to a chapter on the choice of a machine, there are two sections devoted respectively to instruction on the management of the machine on the road and to its care in the motor house, and many practical hints are embodied therein. A new section on Continental touring has been embodied, and a collection of useful tables giving calculation for speed, horse-power, and gearing has been added.

The existing law with regard to motor cycles is also reviewed, and a copious index will prove of great assistance to the rider who wishes to trace information regarding any definite defect of running or detail of mechanism

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address,

LENSES IN GOGGLES.

Sir,-I am one of those poor unfortunate people who have to wear glasses at all times, and although I can, and do, wear them underneath my goggles it struck me that it would be very much more comfortable to have one's own

lenses incorporated in the goggles.

I wonder whether any of your readers could tell me the "Twonder whether any or your readers could tell me ale name of a good and enterprising optician who could undertake such a job. I think if any optician of good standing were to take this up, and to advertise the fact, he would find there was quite a lot of money in it.

E. R. TOYSTER.

SINGLE-LEVER CARBURETTERS.

-Now that several leading motor cycle manufacturers are fitting single lever carburetters, it would interest many of your readers to know the experience of those drivers who have them fitted to their respective machines. Personally, I have ridden motor cycles since 1903, and have now a 1920 Enfield combination fitted with an Amac single lever. I have not yet tested my consumption, but feel satisfied

that I am getting good results, have no difficulty in starting, and acceleration is excellent, but I still think that my carburetter could do with more air at half throttle, though if I fitted some means of giving more air, I should possibly find I am wrong. I still have a sneaking regard for the two levers.

D. C. WILLIAMS.

SOPWITH MOTOR CYCLES.

Sir,-Announcements have recently been appearing offering for sale Sopwith two-stroke motor cycles. In order to avoid any confusion it seems desirable to state that these machines are not built by the Sopwith Aviation and Engineering Co., Ltd., Kingston-on-Thames, and 65, South Molton Street, W.1, who have no connection with any other company, nor with the manufacture of any motor cycle other than the A.B.C.

If at any future time there should be a change in this company's policy, whereby any other motor cycle is marketed by them, an announcement of the fact will be made.

THE SOPWITH AVIATION AND ENGINEERING CO., LTD. H. B. MUSGRAVE, Secretary.

PREMIUM HUNTING IN MOTOR CYCLES.

Sir,-Manufacturers of motor cycles and their accredited agents have lately suffered from the operations of certain individuals who do not wish to become the bona-fide owners of a motor cycle, but rather desire to obtain possession of a machine for the purpose of resale at a substantial and entirely unmerited premium, and I shall be grateful for the privilege of your columns to draw the attention of the public to two important facts.

First, the premium hunter is rarely, if ever, legitimately connected with the industry, and is not in the least concerned with the interests of manufacturer, agent, or user. For his own private gain he exploits the large demand in evidence

at the opening of the season.

In the second place, as general industrial conditions con-

tinue to improve, ample supplies of machines will pass into the hands of the agents without undue delay. Machines are now being despatched from the works much more rapidly than was the case during the first quarter of the year.

Active measures are now being undertaken to check the evil, and manufacturers reserve the right to withdraw, in respect of motor cycles bargained for in this fashion, any guarantee or other advantages which might otherwise attach.

Purchasers should consult the nearest agent of the machine he or she desires, so that their interests and their purse may be safeguarded.

Safeguarded.

President British Cycle and Motor Cycle Mannfacturers' and Traders' Union, Ltd.

T.T. ENTRY FEES.

Sir,-Your interesting paragraph about the T.T. races and the entries for this year's event prompt me to urge your journal to use its influence to obtain some remission of the heavy entry fee of £21 for the genuine private owner riding his own machine. In the Six Days Trials this is done without any marked deterioration of the standard of riding. In my opinion, the reduction of the T.T. entry fee to, say, 28 8s. or £10, would not give rise to any incursion of careless riders on dud machines.

Swansea.

ACETYLENE GENERATORS.

Sir,-I recently purchased a Low generator. I ordered "small car" size with attachment for a sidecar, and when it was delivered it was quite easily fixed on the frame of the chassis. At first, I had trouble with it, but returned it to the makers, who found out the error and corrected it. I am now satisfied with it. Prior to using this, I had to fill my generator every night. I now have a powerful head lamp on the cycle and side-I now have a powerful head lamp on the cycle and side-car, and the rear light on the cycle gives a purer and steadier light, and I have had no trouble whatever with my rear light going out. Personally, I prefer the Low generator to electricity. With the exception that it requires a match to light the lamp, it can be turned on and off in the same way as electric light. I should like to add I have no interest in the makers. E. HARRIS.

SPEED WOBBLE.

Sir,—The other day I was rushing a 1 in 5 gradient, and at the foot of it I was touching the 45 m.p.h. I was partly baulked by a car at this spot, and had to ride close in the kerb, where I struck a No. 1 pot-hole. This gave my front wheel a violent jerk to the left, and it at once swing a contract of the contract of over to the right and started the famous wobble. Half closing the throttle, I exercised the whole of my strength to counteract the increasing period of the swerves, and was successful, and straightened out suddenly with quite a jerk. There were about eight to ten complete oscillations, and the sensation of it to my hands and arms was identical to that of trying to push a gyroscope out of its precession. I know of no other sensation with which to compare it, leaving out, of course, the sensations at the pit of the stomach, which is not of the gyroscopic order, except at sea.

One must assume that the small weight of the rims and One must assume that the small weight of the rims and that the spokes is sufficient to produce gyroscopic action, and that the front wheel being suddenly put out of its plane, would at once set up gyrations on its own axis, which would increase in period unless checked by sheer force, which I did on this occasion. The back wheel being in a fixed plane would certainly influence the front wheel, which everyone knows

who has to make an awkward turn at speed

It appears to me that were there no gyroscopic action, after my first swerve to the left I should have continued thus until I fetched the left bank of the road, nnless I had a sufficiently wide space to make a big sweep and work round to the straight ahead again. The machine is a 5 h.p. J A.P. twin with a big rake on the front forks.

STARTING TIPS.

Sir,—In reply to "J.M.M." re easy starting of B.S.A., I notice he says that it requires a "40 h.p. depression." The trouble, I take it, is one of two things—either too heavy engine oil or sticking clutch plates. If B.S.A. gear lubricant is used, the latter trouble is practically non-existent, provided that the maximum amount of push is available on the clutch rod.

As to the first named, if the engine oil is as advised by manufacturers, the only method of releasing is to prime; but

in any but cold weather this should not be necessary.

If "J.M.M." will open up his jet half a turn or so more than normal with air control at about a quarter open and the throttle at about half open he should be started up after say a couple of "smart depressions." I encountered just the same trouble on a 1915 B.S.A. chain-cum-belt, but after thoroughly washing out the gear box and taking up excessive clearance in operating rod, afterwards using correct gear box lubricant, I had no further trouble.

DERBY.

Derby.

Sir,—I notice that "J.M.M.," Tenterden, is asking for starting tips on a B.S.A. model. The following may be useful as found from experience on my model:
1. Only slight injection on starting from cold.

2. Air lever as well as petrol lever opened about one-third of an inch, as in the B.S.A. adjustable carburetter one seems to get a better mixture.

Magneto fully retarded. Work the piston to the top of the stroke before giving

vigorous kick.

Open adjustable jet on B.S.A. 'carburetter about three turns (complete turns) and close again to required position when the engine is running.

J. A. FREEMAN. when the engine is running.

INTER-CLUB COMPETITIONS.

Sir,-As the hon, trials sec, for the Maudes Challenge Shield for the inter-club team competition confined entirely to private owners, being promoted by the Surbiton and District M.C.C. to be held on Saturday, June 5th, the letter from your correspondent S. W. Phillpott is particularly interesting to me, and I think he will agree that the competition proposed entirely meets his suggestions, and the committee of the promoting club hope that the support from the affiliated clubs will warrant them making the event an annual one. The committee have endeavoured to eliminate the trade entrant by their definition of a private owner, and they hope that clubs entering will cudeavour to make their teams as "amateurish" as possible.

Furthermore, the trade members of the club are gladly giving their assistance, and any other assistance by the trade

will be gladly welcomed.

May I add that should any affiliated club secretary not have received particulars of this competition I shall be happy to forward them.

W. PRATT, S. and D.M.C.C., Hon. Trials Sec. Inter-club Team Trial for Private Owners. 100, Great Portland Street, W.

INFLATED PRICES.

Sir,-We should suggest that your correspondent at once write to the manufacturers, and call their attention to the overcharges, when, if the agent offering the goods is a recognised agent of the firm concerned, we think that future supplies will be stopped.

In perhaps the case of every motor cycle manufacturer of repute, it is a breach of the Agency Agreement for recognised agent to offer to sell a new machine at a higher price than that ruling at the date of sale; and if any readers of your paper should meet with such a case they would be rendering a service both to the manufacturers and to their

reputable agents if they at once report it.

Unfortunately, there is a certain class of trader, although not a recognised agent, who manages to obtain new machines by paying the full retail price, or even more, and who is selling these machines at a figure considerably in advance of the manufacturers' list price, probably making a bigger profit in this way than the respectable agent.

THE SERVICE CO. (LONDON), LTD.

Sir,-W.th reference to the letter on inflated prices from "E.J.L.," in your issue of April 15th, I had a very similar experience myself.

A dealer in North-west London, who advertises in your paper each week, asked me £125 for a 4 h.p. Triumph motor cycle, at a time, some months ago, when the makers' list price was £92.

I think the Triumph Cycle Co., or one of the associations who profess to look after the interests of motor cyclists, ought to do something in such a case.

F. A. HUDSON, M.A., A.M.I.C.E.

CARBURETTER DESIGN.

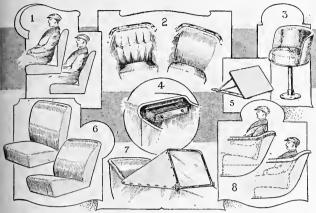

Sir,—Regarding Mr. Holland's letter of April 15th, and the reply of Mr. Parr on April 20th, I would like to say that I think there can be no doubt that variation in tem-perature has a good deal to do with carburation, and that the warmer the temperature the less petrol must be used. To anyone in doubt, I would suggest this experiment.

Obtain access to an engine fitted with a dynamometer so that the exact power can be ascertained, get this engine running at its best, fitted with a carburetter that has either a variable choke tube like the Binks, or with an extra air a variable choice tools has been running for some time, and is thoroughly warmed up, observe the power given out, then gradually heat up the float chamber, and you will

then gradually near up the noar champer, and you will observe the power drop; but this can be regained either by expanding the choke tube or admitting extra air. "Clericus," in the issue of April 29th, says that a disadvantage of the Binks carburetter on the Scott is that it is exposed to the cold draught. I do not think this is any disadvantage, provided a hot air pipe is supplied. We always advise Scott riders to use a hot air pipe, and make a special hot air set which consists of an elbow, length of flexible pipe, and a muff which fits on the cylinder top. flexible pipe, and a man which has on the cylinder cope. This supplies the carburetter with warm air practically at once. I cannot conceive why manufacturers of two-stroke

All riders do not view these huge road vehicles with the apparent amusement of the motor cyclist shown, who evidently has not been making vain endeavours to pass the char-a-banc on a narrow road. Both The Motor Cycle and The Autocar have continually urged the adoption of mirrors on lorries and slow-moving traffic, or some other means of notifying the driver that a vehicle wishes to pass.

STUDYING THE SIDECAR PASSENGERS' COMFORT.

Some minor faults of the modern sidecar and means to remove them: (1) The average Some minor taults of the modern sidecar and means to remove them: (1) The average back cushion is either too upright or has the thickest part of the upholstering too high; the small of the back has no support. (2) A plain back cushion is more comfortable than one which is "buttoned," a type difficult to clean. (3) Adequate accommodation is not provided for the juvenile passenger. (4) A small drawer or locker is a great convenience to the lady passenger, but it should not be so low that it restricts leg room. (5) Adjustable footrests are desirable in long sidecars. (6) Seat cushions should slope to the rear. (7) A side curtain is a necessity with windscreens. (8) Seat cushions are usually too high. Passengers like to si "in," rather than "on," sidecars.

BLACK FINISH.

Sir,—In your issue of April 8th, "Ixion" says in his "Occasional Comments," "It is a mistake to suppose that all the commercial 'black finishes' for handle-bars and suchike are preferable to nickel-plating." I am quite sure he would agree with me that if there were some simple means of restoring the black finish to the damaged parts black finish would be infinitely preferable to nickel-plating. May I therefore quote a method which was given to a reader some weeks ago in your sister journal, The Amateur Photographer and Photography? It was as follows:

"Apply a coating of Brunswick black, and as soon as this coating is tacky cover it thickly with a fine black

this coating is tacky cover it thickly with a fine black powder—lamp black, vegetable black, or ivory black will do. This powder should be left for a few days for the Brunswick black to become quite hard, and can then be

dusted off.

This, I think, is far better than returning the bars to the factory. . Hove.

TAXATION.

Sir,-I consider the proposed tax on motor cycles most unjust. I, as a motor cyclist, do not grumble at paying my full share, but I think the proposed £4 on a combination is out of all reason; and as the motor cycle is the poor man's is out of all reason; and as the motor cycle is the poor man's bus, and is in fact the first thing bought by not only the poor man, but also the rich, it will greatly hamper trade, and I predict a great falling off in the motor cycle industry. This tax will in a short time kill the motor engineering trade. I think a fair tax, seeing we have to pay more, would be £1 10s. under 200 lb., £2 for over 200 lb., say up to 4 h.p., or solo 44 h.p., and £2 10s. for combination. I don't think anyone would grumble.

If the authorities cannot come to this, I propose that all motor cyclists, who are not dependent on their machines for a living, should start a scheme and hold the machines for always a patter January 1921, till such time as the tax be modified.

up after January 1921, till such time as the tax be modified.
Will someone start this at once?

I will give him my word that I will not touch my machine until the tax is at least reasonably modified.

Sir,-I quite fail to see that the new taxes involve any hardships to motor cyclists. It is agreed that we must pay more, to help to meet the greatly increased cost of road

repair and to help to provide better roads. Though motor cycles do far less damage to roads than cars, good roads are of more importance to the motor cyclist than to any other class of road user, and if we have them we shall save more than the value of the extra taxes. It is absurd to say that an annual tax of £4 is going to ruin a man who can afford to buy and maintain a combination costing over £200. Many spend more than that every year

in quite minecessary gadgets.

The only people who will have to pay appreciably more are those who seldom use their machine, and if they can afford to keep a motor cycle for occasional joy-rides they can afford to pay the tax. The owner of a light-weight will actually pay less than before unless he uses less than twenty gallons of petrol in a year. When rationing was introduced, there was an outcry that two gallons a month was utterly useless!

Another whine is that there should be a rebate on machines made before 1913. As nearly all these must weigh under 200 lb., this is quite unjustified.

The only class who are really taxed more are the sidecar owners, and they will only have to pay £1 more if they use 80 gallons a year-a very moderate allowance.

My opinion is that there is absolutely nothing to complain about, and the motoring organisations might save their energies for some more useful object.

The question whether it is wise to take the tax off imported spirit is political, and does not concern us as motorist

H. C. WYLEY.

SLEEVE VALVE ENGINES.

Sir,-I note, in your remarks on sleeve valve engines in your description of the Allison sleeve valve engine in *The Motor Cycle* of April 22nd, that you do not think that this type of engine always holds compression well.

This does not agree with my engine testing experience on the Burt single sleeve valve engine. In this type of engine, a ring used to be fitted in the detachable head, in order to a ring used to be intend in the detachable head, in order reduce gas leakage from the combustion chamber past the inside of the sleeve. But I found on test that by leaving out the ring there was a gain of 3 b.h.p. at 1,900 r.p.m., even after prolonged tests at full load, and that the compression pressure was slightly higher at the end of the test, when measured under running conditions with an Okill pressure indicator. There should be no trouble with distortion in the sleeves if they are heat treated after rough machining and before grinding.

I am afraid that Mr. Allison will experience some trouble, due to pre-ignition, with the bevelled edges of the inner sleeve, and that his mechanical efficiency will be low, owing to the use of two sleeves. He will probably also experience some trouble in getting his patent through, owing to its similarity to the Knight and Burt engines.

D. P. MUIRHEAD, A.M.I.A.E.

PETROL CARRIERS. Sir,-There is one point I desire to call attention to in sidecar construction, and that is the fitting of luggage or petrol carriers. When one buys a new sidecar it is about the first thing one thinks about, and I have been through this experience again for about the umpteenth time. Obviously, the carrier must be sprung, or both chassis and carrier contents suffer. In the present instance the fitting involved removal of the body, dismounting certain of the upholstery and internal woodwork in order to secure suitable points for attachment. I would urge manufacturers either to fit carriers as part of the standard equipment or to market a carrier as an extra, but, in all cases, to incorporate in the design of the sidecar bolts or plates or some other points to which a person of average intelligence can fix either a standard or personally designed carrier attachment

Huntingdon.

NEW MACHINES AND AN OLD NAME.

Three Attractive Models of the British Excelsion

A BLACKBURNE-ENGINED lightweight, a two-stroke with flywheel magneto, and a new big single for

sidecar work are to be added to the range of models manufactured by Messrs. Bayliss, Thomas and Co.

Commencing with the simplest form of two-stroke, and ending with an 8 hp. de luxe sidecar outfit, British Excelsiors will soon be made in three distinct types, instead of two as at present. Two of the new machines coming into the existing lightweight group, and the third is an entirely new model to meet the demand for a medium-powered utilitarian type of sidecar machine for those who do not feel justified in invest-

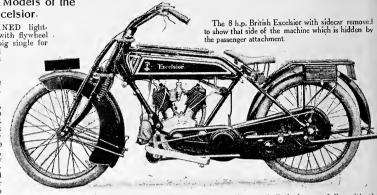

not feel justified in investing in a de luxe motor cycle such as the present-day big twin.

This medium powered machine will have a specification similar to that of the pre-war outfit modified to suit present-day conditions, but sans such items as interchangeable and quickly detachable wheels, spare wheel, dynamo lighting, enclosed all-chain drive, hood and screen, and the many other refinements which have helped to raise prices to figures in the neighbourhood of £200.

A 650 c.c. Single.

It is intended to make this model essentially a sidecar outfit, and the machine we inspected last week in course of erection was distinctly promising. A particularly heavy head was fitted—an essential with all sidecar machines which was not fully appreciated by pre-war designers. The engine is a moderate compression single of 650 c.c., and is of the same design as the engine fitted in the 4½ h.p. single before the war. For the benefit of those who are comparatively new to motor cycle matters, we remind readers that those responsible for the

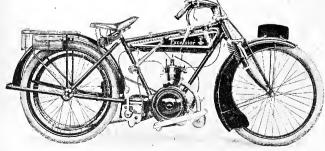

Excelsior have had considerable experience with "big singles"; one of the 1914 models which was sold in large numbers had a single cylinder of no less than

The new tapered head, which has ½in. ba!ls on the bottom race.

800 c.c. capacity, and proved to be a very powerful machine, much smoother in its running than would be imagined from the size of its cylinders.

The first flywheel magneto Villiers engine to be illustrated in a machine—the latest two-stroke Excelsior.

As we shall deal more fully with this model at a later date, we will say no more at the moment, except that in our opinion Messrs. Bayliss, Thomas and Co. are acting wisely in reintroducing this type.

New Lightweights.

The two new lightweights have frames of practically the same type as that used for the present two-stroke and 2½ h.p. J.A.P. models. They are fitted with the new Villiens engine, with flywheel magneto and the 2½ h.p. Blackhurne engine respectively.

The first-mentioned presents a quite attractive appearance, and at a glance one is impressed by the general "cleaning up" in design which results from embodying the magneto in the flywheel. From reports, and also from our own impressions of this engine, the new Villiers appears to be a great advance on the usual two-stroke engine. We know that the improvements embodied in the new engine are the result of several years' experimental work, and have not been obtained by mere guesswork, therefore a great deal is expected from the new engine.

We have often urged manufacturers to remember the requirements of the short rider, who requires a small machine with an engine larger than the average lightweight, and we were glad to avail ourselves of the opportunity to try the Excelsior makers' conception of this type of machine. The frame is low, and compact enough for the shortest rider, and the 2\frac{3}{2} h.p. Blackburne engine has earned for itself a reputation as a desirable power unit for serious solo work.

A Handy Model.

On the miniature testing track at the Excelsior works the little machine proved exceptionally tractable and most comfortable to ride, and we have no hesitation in prophesying that it will become one of the most popular models of the Excelsior range.

The 8 h.p. sidecar machine has undergone several modifications since we last described it in the autumn of last year. The wheelbase has been shortened con-

New Machines and an Old Name .-

siderably and an entirely new steering head embodied. This is of rather unsiderany and an entirely new steering head embodied. This is of rather unusual design, is in one piece, somewhat larger than the average, and having 4in, balls in the botom race and 75 in. at the top.

As will be seen from one of the illustra-

tions, the head tapers and has no projections such as give many heads the appearance of having been built up. There are strengthening webs above and below the front down tube which combines a lug for the sidecar connection,

Equipment.

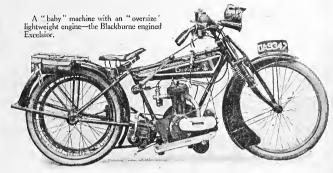

All chain transmission, totally enclosed All chain transmission, totally enclosed in substantial metal cases, quick detachable and interchangeable wheels (with a spare on the back of the sidecar), Magdyno combined lighting and ignition set, and leg shields are all points tending to make the machine of the de luxe type, while the sidecar is very roomy, and is fitted with folding grid, a neat V screen, side shield, hinged dash, adjustable spring footrest, and hood. footrest, and hood.

The standard finish of all Excelsiors is now black, relieved with light blue lines.

Messrs, Bayliss-Thomas have only been installed in their new works at Tyseley,

Birmingham, about six months, and as the output is now about eighty machines per week, the value of a new and wellequipped works may be appreciated.

A Simple Four-stroke Engine.

Inlet and Exhaust Periods controlled by One Double-purpose Valve.

Many inventors have become attracted by the simplicity of the single valve system of controlling the inlet and exhaust gas flow, and the practice is to be commended if efficiency is not sacrificed.

The Jarvis engine, with a single combined poppet and piston valve controlling inlet and exhaust periods

An experimental model has recently been brought to our notice by Mr. J. Jarvis. of 729, Ormskirk Road, Pember-ton, Wigan, which embodies a dual-purpose valve of decidedly simple con-

No unconventional layout of the engine is necessary; in fact, the appearance of the one under test is reminiscent of the early a.i.v. models of our younger days. eany a.i.v. models of our younger days. The diagram of the valve chest, which lies to one side of the cylinder, shows that a single poppet valve carries a piston valve on its stem. The poppet valve is lifted through the agency of a cam and warming your throughout. rocker, and remains open throughout exhaust and inlet periods.

Valve Action.

During the exhaust stroke the valve is lifted off its seating, and the piston is litted off its seating, and the piston valve covers the lower annular port (inlet) in the valve chamber, and the gases pass through the upper annular port as the piston rises. Immediately before the induction stroke commences, a further raised portion of the cam lifts the valve still higher, and the cylindrical restien was constrained. portion now covers the exhaust orifice and unseals the one leading from the inlet pipe. The new charge passes through the hollow piston valve, over the poppet valve seating, and so flows into the cylinder. When the crank reaches the

limit of its downward travel, the valve closes completely, and compression and firing strokes take place in the ordi-

nary way.

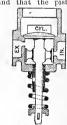

It will be seen that the poppet valve holds compression and that the piston

valve is not sub-jected to any pressure, its function being merely that of a distri-buter. Amongst other advantages claimed for this construction, it is said that the engine has parti-cularly good pulling powers, especi-ally at low speeds, and that it does not suffer from overheating.

We are hoping to have a road test of this inter-

esting little engine in the near future. In the meantime it is interesting to observe the tendency at the present time for designers to depart from the conventional in valve type and mechanism.

There have probably been hundreds of attempts to eliminate the poppet valve by introducing sleeves of various types.

Section through the valve chamber, showing the ports and the double-purpose valve.

"OVERSEAS" TRIAL IN YORKSHIRE.

On Saturday, June 5th, the Ilkley M.C. and L.C.C. will hold a sporting one-day reliability trial over a strenuous course, including the foot-hills of the Pennines. This event is one of the twenty officially sanctioned by the A.C.U., and entrants will be assured of a thoroughly good run with a minimum of irksome regulations to worry them. Some hint as to the "Overseas" nature of the route selected may be gleaned from the fact that a

third-class certificate will be awarded to all who finish the course and are not more than thirty minutes late at any control.

There are twelve classes for machines

of various capacities—solo and passenger— and the following awards are offered: The Ilkley trophy and gold medal for best individual performance; the Palmer trophy and gold medal for best trade performance; the Scott trophy for best amateur performance; gold medals for best performance in each class; and first, second, and third-class certificates. In order that strangers to the district may have a fair chance of qualifying for the Ilkley trophy, no one who is or has been on the membership list of the club during 1919-20 will be eligible for this award. Entries close on Saturday, May 29th (first post), and full particulars are obtainable from the hon. sec. Mr. H. W. Sellers, Langley Avenue, Bingley, Yorks.

"The Motor Cycle" 42d.

With this issue the price of The Motor Cycle is raised to 41d., for reasons which have already been stated.

Timing Hill-climbs by Wireless.

In a lecture given to the Newcastle and District M.C., Mr. F. Steven, a wireless expert, stated that he hoped shortly to time a hill-climb by wireless.

Consumption in Rel:ability Trials.

J. E. Greenwood, the winner of the Midland Challenge cup in the Victory cup trial, and one of the victorious Sunbeam team, gives some interesting information with regard to his outfit. Using a 3½ h.p. Sunbeam sidecar weighing 450 lb., and carrying 30 st. over the hilly Midland course, he averaged 75 miles to the gallon. The carburetter was a Binks.

Results of Open Scottish Hill-climb.

The official results of the recent hillclimb on Redstone Rig, organised by the Edinburgh M.C. are as follow:

HANDIOAPS.

350 c.c. (open).—I. B. Alexander (2% Douglas).
361-600 c.c. (open).—I. B. Alexander (2% Douglas).

he N.II T

The price of the N.U.T. motor cycle as been increased to £165.

Our Isle of Man correspondent tells us hat the Norton riders, under the comsland recently, for the purpose of testig their machines generally, especially ears. They expressed themselves quite stisfied with the condition of the course ith the exception of the stretch from ulby to Ramsey, which is particularly ad, but which is now being rapidly paired. The Nortons are said to possess wonderful turn of speed, and, given reasonable amount of luck, the riders e no reason why they do not stand an cellent chance of carrying off the ophy. Amongst the nine Korton comittions entered, which includes a team compete for the special trophy, is Douglas Brown, who rode a Rover in 1914. The Norton riders approved of the alteration in the course which cuts off the corner at the top of Bray Hill, and expect this will enable them to get a high speed out of the machines going down Bray Hill, which will now be considered one of the fastest parts of the This alteration in the course also affords a much smoother surface than the one formerly employed, and this is, of course, a point in its favour.

Additional Entrants.

In addition to the list of entrants for the T.T. given in last week's issue, the the T.T. given in last week's issue, the following have entered the contest: Junior race—N. C. Sclatcr (3 h.p. Aurora), A. H. Alexander (23 h.p. Douglas), E. Greenwood (23 h.p. Douglas), and R. O. Clark (24 h.p. Levis). Senior race—N. C. Sclater, jun. (3½ h.p. Norton), A. H. Alexander (3½ h.p. Douglas), R. Lucas (—), and A. J. Moffatt (3½ h.p. Norton).

It should be pointed out that the six entries by A. J. Stevens, Ltd., as given in last week's issue, are for the Junior race. The one in the Senior class (a 23 h.p. machine) has been entered as a sporting chance among the bigger machines. The Ivy rider will be P. G.

R. Loughton, mounted on a 23 h.p. Douglas, will represent the Newcastle and District Motor Club.

"The Motor Cycle" Telegram Service.

Following our practice during former T.T. races, it is our intention to telegraph the lap results to every important town in England. These telegrams will be dis-played in the windows of the most important agents, and those who have suitable means to exhibit them and wish to do so should communicate with us at once. Thus, a large number of our readers who are nnable to witness the blue riband event of the motor cycle world may be able to follow the racing lap by lap.

Victory Cup Trial.

The following additional awards have now been made:

SILVER MEDALS.

A. Woodfield (5.6 James 8c.).
H. Burley (4 Verus-Blackburne).
G. F. Baragwanath (4 Triumph).
H. Glendinning (8 Blackburne 8c.).
G. G. Barnard (32§ Simbeam).
H. Wood (45§ B.S.A.).
E. R. Wintle (44§ James).

In addition to the above, we wish to add the name of A. F. Selby (4 Blackburne), who was inadvertently omitted from our list in the issue of May 6th.

Scottish Speed Championships.

Owing to the practice for the Tourist Trophy Races commencing on May 31st, and the probability that some riders who would otherwise be entrants for the Scottish Meeting will be in the Isle of Man on June 5th, it has been decided to postpone the Scottish Meeting to Saturday, September 4tb.

A.C.U. East Midland Centre.'

The following notice, which contains an element of mystery, has been issued by the East Midland Centre of the A.C.U.: "A meeting of representatives of motor cycling clubs in the East Midlands division will be held at the Red Lion Hotel, Cambridge Street, Sheffield,

on the 15th inst. at 4.30 p.m.
"Vital matter arising out of the organised opposition of the Auto Cycle Union to the Ilkley M.C.C., whose open trial is arranged for June 5th, will be discussed. As the matter affects the life of established clubs and those in process of fermation in the Midlands and North, it is essential that every club be represented at the meeting.

Tea will be provided for all visitors. Notification of attendance in order to provide the necessary accommodation must be sent to the hon, secretary, J. Simmonds, 10, Cranmer Street, Notting-ham, not later than the 14th inst.

A cheering sight for prospective owners of Bleriot-Whippet cycle cars. This is the first large batch ready for delivery, and would indicate that the motor industry as a whole is doing its utmost to meet the public demand. This little runabout is fitted with an air-cooled engine and final belt drive.

The Single-cylinder Holds its Own.

Fast Speeds in the Bristol M.C.C. Speed Trials at Weston-super-Mare.

An animated scene at the starting point of the Bristol M.C.C. Speed Trials on the beach at Weston-super-Mare.

BEACH racing is a form of motor cycle activity much more closely supported in America than it is in this country.

This state of affairs may be accounted for by the fact that here we have only comparatively few places which lend themselves to the occasion. The sands at Weston-super-Mare are admirable for the purpose, and the Bristol M.C.C. are fortunate in having the co-operation of the Weston Urban District Council in running the now famous annual speed trials there.

Despite slight rain in the morning, the surface of the sand last Saturday was reasonably firm and dry, and some quite high speeds were attained over the mile

Another Day Out for Dance.

In a quiet, unostentatious way, G. Dance, the Sunbeam expert, put up some excellent riding. His methods are not nearly so spectacular as those of many who achieve only considerably slower

speeds. He made the fastest time of the day on a 3½ h.p. Sunbeam with side-by-side valves, covering a mile in 56s. (64.28 m.ph.)—a truly fine performance from a standing start.

The event was rather a field day for the Sunbeam, but E. Kickham, riding Douglas and Diamond machines, and the

A.B.C. team did exceedingly well.

The scooter events were cancelled, owing to lack of support, and the first event was one for 250 c.c. solo machines. Three riders faced the start, these being G. F. Tozer (24 O.K.-M.A.G.), E. Kickham (2½ Diamond), and H. Newey (2½ Levis).

The latter made an excellent start, and led down quite a third of the course. Kickham's little overhead-valve Diamond was rather difficult to start, but he eventually gained on Newey and finished a winner in 1m. 24s. (42.8 m.p.h.).

Kickham was not troubled with had starting in the subsequent classes, in which he rode the yellow overhead-valve 350 c.c. Douglas. This machine was in splendid tune and started instantly, and gathered speed in a few yards. Racing against Dance (23 o.h.v. Sunbeam), he was much quicker with the running mount than the Sunbeam exponent was with the clutch start, but he was slightly slower was the surgest.

than the Sunteau expectations are the course. The 500 c.c. class presented an opportunity for the speedmen to show their form, and the first heat felt to Dance, who covered the mile in under the minute, being followed 3\(^2\)s. late by E. Colmer, who made a splendid get-away on his 3\(^2\) h.p. Norton. In the second heat E. Kickham (2\(^2\) Douglas) was only \(^2\)s. slower than J. Emerson (5 A.B.C.). C. Sgonina, of whom much was expected, had trouble with his steel cylinder o.h.v. \(^3\)\$\(^4\) h.p. Norton only a few yards from the start. The third heat was won by F. J. Boshier-Jones (5 A.B.C.), who easily got ahead of G. F. Tozer, the second man, who rode a \(^3\)\$\(^4\) h.p. Rudge Multi.

Dance bettered his time by \$s. in the final, and was followed at an interval by Kickham.

31 Single Wins Unlimited Class.

Fastest time of the day was touched in the "unlimited" class by Dance, who played with entry by streaking the mile in 56s. Porter (3 A.B.C.) was second in the final.

Sidecar Performances.

Single-cylinder machines proved all-conquering in the passenger classes as in solo. The 23 h.p. Sunbeam, piloted by Dance, easily won from Bailey (23 Douglas sc.), while Sunbeam and Norton were first and second in the 500 c.c. event, being ridden by Dance and Colmer respectively.

Undoubtedly the most exciting race of the day was the final of the unlimited sidecar class, when Dance (3½ Sunbeam

A variety of starting methods. G. Dance (in white jersey) uses the clutch of his 2\frac{3}{4} h.p. Sunbeam, while the Douglas riders push off.

Four Reasons Why

you should always specify

- 1. The Rubber is a mixing decided by exhaustive and lengthy tests. It resists wear and does not cut easily.
- 2. The Walls are strong, and with correct inflation last as long as the tread.
- 3. The Lining made of the best canvas; put together scientifically and well impregnated with rubber.
- 1. The Beads firm and correctly shaped, so that there is no "play" in the rim with consequent chafing bove the bead, so prevalent in many tyres.

What do you know about your motor?

An Important Work for every Motor Cyclist.

The time is past when it required an expert engineer to drive a car, but a working knowledge of the various parts of a car and their functions is still essential to really successful driving, and the importance of this work to every owner and driver of a

motor car, cycle, or cycle car can hardly be over-estimated.

"The Book of the Motor Car" is the first really comprehensive work on motor cars, cycle cars, and motor cycles ever published.

It is full of invaluable information on all problems of driving

and repairing, instructions being given for all possible difficulties in language that can be understood even by the most un-mechanical mind. The following are a few of the subjects dealt with: Cylinders, valves of all kinds, different types of engines, carburcters, ignition, silencers, gear and elutches, radiators, cooling systems, brakes, lubrication, lighting systems, wheels, tyres, fuels and how to use them, tools, and repair appliances, etc., etc.

appinances, etc., etc.

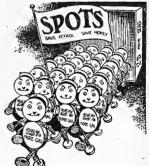

It is profusely illustrated with full-page plates, drawings in
plan section and elevation, diagrams, and photographs, as well
as a series of sectional movable models in colour.

WHITSUNTIDE RUN TO LAND'S END AND BACK.

The fact that most long-distance trials always attract a good entry shows the popularity of this class of sport. The London-Exeter and London-Land's End are events which have become classics entirely on account of the support they have received, while Midland riders also favour the Land's End trial organised by the Birmingham M.C.C. This latter event takes place at Whitsuntide, starting from the Maypole Hotel, Alcester Road (six miles from Birmingham), at 3.30 a.m. on Saturday, the 22nd inst. As the route includes Porlock, Lynton, and Countisbury hills (the latter on the return journey), competitors are not only promised a sporting trial, but a picturesque run also. Owing to the limiting of open events this year, the 1920 trial is for members only, but as the club boasts a very large membership, a good entry is assured. The chief award in this competition is the Lycett trophy, and entries close to-morrow (Friday, the 14th).

CAR IMPORTS INTO FRANCE PROHIBITED.

With a view to improving her very unfavourable rate of exchange, France has prohibited the importation of about 200 articles, among them being automobiles of less than 2½ ton weight. Some doubt existed as to whether this general term comprised motor cycles, but according to a ruling given by the competent authority, these machines will continue to be admitted as heretofore. This matter is of some importance to the home industry, for British machines are popular on the French market. The new French makers, whose machines attracted considerable attention

at the last Salon, by reason of their original and pleasing design, are not yet making deliveries. In all cases, however, work has been pushed on rapidly and stock rooms are well filled with parts, so that when assembly commences, so that were assembly commences, deliveries ought to be made in important quantities. It is expected that by the month of July such firms as Blériot, Louis Clément, Janoir, and the French A.B.C. Company will be in a section to addition the such company will be in a position to deliver many machines to the nublic.

FORTHCOMING TRIALS.

650 Entrants in two Whitsuntide Eyents. The Popularity of the Long-distance Trial.

350 Entrants for this Year's London-Edinburgh Run.

Entries for the London-Edinburgh run surpass ali previous records, no fewer than 550 having been received. Com-petitors are especially warned, in view of the number taking part in the event, to drive with as much consideration as possible, and to be particularly careful in the hotels on the road as regards demeanour, dress, and general behaviour.

Any breach of good conduct on the part of competitors might seriously endanger the possibility of holding the run on future occasions.

Supper for competitors will be supplied by the proprietor of Ye Olde Gate House Hotel at 3s. 6d. a head between the hours of 6 and 8.45 p.m. on Friday, the 21st inst. Notice that supper is required should be received by the proprietor not later than May 15th. Tele-

phone number, Hornsey, 2154.
Mr. L. W. R. Morley, proprietor of
the North Road Garage and Motor Works, Great Ponton, four miles south of Grantham, informs us that he will keep his garage open all night on the occasion of the London-Edinburgh run, so that he can assist any competitors who may require repairs, fuel, tyres, tubes, etc. He also has a 1 ton box van which may be of service.

Cycle Car Racing at Whitsuntide.

SEVERAL cycle car and light car events are arranged for the Whitsuntide meeting at Brooklands, which is being organised by the Brooklands Automobile Racing Club. The clerk of the course, Col. F. Lindsay Lloyd, Brooklands Motor Course, Weybridge, will send announcement sheets to intending competitors of this or future events on receipt of application.

Cork Open Trial on Whit-Monday.

A really sporting event over a pic-turesque course (including Killarney, Waterville, Kenmare, and Glengarriff) has been planned by the Cork and District M.C.C. for their Whitsuntide open trial. There will be several formidable test hills and a flexibility test, the latter being in the form of a fast climb of 220 yards. Figures of merit will be found by The Motor Cycle formula.

The prize list includes the Hutchinson Cup, the Novices' Cup, two prizes for sidecars, one each for best performance by a rider of a lightweight and a lady competitor respectively, a team prize, and a special award for fastest time in the flexibility test.

M.C.U.I. or A.C.U. licences are ecessary. Entry forms and particulars necessary. may be obtained from the hon. sec., Mr. R. S. Russell, 4, Princes Street, Cork. The entry fees are: Members 20s., nonmembers 25s., and teams 15s.

Liverpool M.C. Open Speed Trials.

Over 300 entries have been received for the above event, which will be held on a private road at Storeton, near Birkenhead,

on Saturday, May 15th.
Commencing at 1 p.m., there are thirty
classes to be run off, and it is expected
that some of the new models prepared for the T.T. will make their first public appearance. Many well-known riders are competing.

Trial in South Wales.

On Whit-Monday the first reliability trial organised by the Eastern Group of the Welsh motor cycle clubs will take place. All motor cyclists in South Wales are cordially invited to enter. close on the 20th inst.

Full particulars can be obtained from the hon, trials sec., B. R. Evans, 22, Glantorvaen Terrace, Blaenavon.

Racing at Brooklands.

On July 10th the Motor Cycling Club will hold a race meeting at Brooklauds. will hold a race meeting at Brookiatus. A special cup in memory of the late Sir R. K. Arbuthnot, to be called the Arbuthnot Cup, has been presented by the club, and is open to riders of motor cycles of 350 c.c., the size of machine on which the late Admiral used to race on Brooklands track. The cup is not a challenge trophy.

Next Brooklands Meeting.

The following programme has been arranged for the race meeting organised by the B.M.C.R.C., which will take place on the 29th inst. Racing will commence at 2 p.m.

neuce at 2 p.m.

Event 1.-Novices Scratch Sprint, 2 laps. Solo (350 c.c. and under).

Event 2.-Novices Scratch Sprint, 2 laps. Solo 500 c.c. and under).

Event 2.-Novices Scratch Sprint, 2 laps. Solo (1,000 c.c. and under).

Event 3.-Novices Scratch Sprint, 2 laps. Motor cycles and sidecares (500 c.c. and under).

Passenger to be carried.

Event 5.-Novices Scratch Sprint, 2 laps. Motor cycles and sidecares and three-wheeled card.

Event 5.-Novices Scratch Sprint, 2 laps. Motor cycles and sidecares and three-wheeled card.

Event 5.-The Junitor One Hour T.T. Trial Race. Solo, stripped (350 c.c. and under).

Event 7.-The Senior One Hour T.T. Trial Race. Solo, stripped (500 c.c. and under).

Event 7.-The Senior One Hour T.T. Trial Race Solo, stripped (500 c.c. and under).

All particulars as at the event No. 8 may All particulars as at the event. No. 8 may

All particulars as to event No. 8 may be obtained from Mr. F. W. Barnes, Zenith Motors, Ltd., Hampton Court, and for other events from the hon. sec., Mr. T. W. Loughborough, The Mill House, Warlingham, Surrey.

CONTINENTAL EVENTS.

International Six Days in France. The Grand Prix.

THE detailed rules of the 1920 French 1 Six Days Alpine Trials are expected shortly. These trials, which are organised by the Union Motocycliste de France, are for motor cycles of 350, 500, 750, and 1,000 c.c., for sidecars of 500, 750, and 1,000 c.c., and for cycle cars of not more than 1,100 c.c. The competitors will meet at Grenoble, where weighing-in and sealing of the machines will take place on July 24th and 25th, the actual competition beginning on the following day,

There will be four stages around Grenoble, on the 26th, 27th, 28th, and 29th of July respectively, each day's run being approximately 135 miles in length, and comprising the most difficult mountain roads to be found in this region. On July 30th the machines will be on exhibition in Grenoble, and the two following days will be spent in a regularity trip to Paris, the trials thus finishing in the French capital on the evening of August 1st.

The average speed to be maintained is 183 m.p.h., except for the sidecars, during

the four mountain stages, when the average is reduced to 17% m.p.b. All the machines will be sealed, and the number of spare parts carried will be officially controlled. At the start 1,000 points will be given to each rider, and deductions will be made according to an official list. For each spare part used five points will be lost. One point per minute will be deducted for late or early arrival at the different controls, with a tolerance of five minutes each way. In view of the mountainous nature of the roads, it will be a very difficult matter to complete the trials with a clean score.

Circuit de Paris Abandoned.

The touring competition from Paris to La Baule and back, which was fixed for the first few days of May, has had to be abandoned, owing to various reasons, among them being the petrol shortage and the lack of entries. French motor cycle events have so far been very unfortunate. After the Paris-Nice, the results of which were annulled, the Circuit de Paris trials had to be abandoned, and now the Paris-La Baule has suffered from a similar fate.

The Grand Prix.

Preparations for the Grand Prix of the Motor Cycle Club of France are apparently in an advanced stage. The weighing, sealing, and verification of machines will take place on May 29th at M. F. Gobel's garage at 21, Boulevard Magenta, Fontainebleau.

The machines on arriving must be furnished with two discs, one on each side, and also a plate in front carrying the competitor's number. The frames, cylinders, head, and discs on all machines will he sealed, and the same remarks apply to the sidecar outfits; but in the case of these the sidecar connections will also be sealed. Cycle cars must be provided with number-plates painted white on a black ground on each side of the vehicle. Engines, cylinders, and change-speed boxes will be sealed.

Entries cost 230 frs. per machine. Competitors will be insured against accidents which they may cause to third parties.

AN INTER-CLUB MEET AT HOWDEN.

Some of the 130 members of the Hull, Howden, and York clubs, who took part in a recent outing to the Royal Airship Station in the neighbourhood.

Sutton M.C.C.

It is proposed to form a motor cycle ub in Sutton, Surrey, and any motor clist who is interested should communite with Mr. W. A. Coe, Hylton, The idgway, Sutton.

North Wales M.C.C.

The opening run will take place on the th inst. to Birkenhead, meeting at On Whit-. a.m. outside Denbigh. On Whit-onday a run has been arranged to which y Gross Hill, where it is intended have a hill-climb. Application forms r membership may be obtained from e hon sec. S. V. R. Jones, 1, Ruthin oad, Denbigh.

South Birmingham M.C.C.

Some very good performances were put in the recent sixty miles novices' trial, ich resulted in a win for R. Cooper Allon), with A. Cave (7-9 Indian) ond, and E. Bastock (2½ Enfield) third.
e main obstacle was a watersplash,
uch proved very trying to some of the lers. An excellent tea was provided the "Golden Cross," Henley-in-Arden.

York and District M.C.

Owing to the wet weather, the course ected for the club's reliability trial, ld on the 5th inst., proved very difficult.
imerous hills and watersplashes were luded, and in some parts the course lay ing grass tracks with deep ruts. Of ; fifteen competitors who started only en finished, including three cars, sults: 1, E. Wailing (3\frac{3}{2} \text{ Scott}); 2, A. Reed (3\frac{3}{2} \text{ Scott}); 3, R. B. Russell Triumph); 4, G. Hannon (8 Harley-videon calls) vidson solo).

nb will be held at Garrowby on the h inst. All types of motors, from the oter to the big car, will be represented the twelve classes.

A well organised fast and slow hill-

Leicester and District M.C.C.

Twenty-three competitors started in the reliability trial held on the 2nd inst. The course, which was fifty-seven miles in length, was quite interesting, includ-ing the Leicester Beacon Hill and an exceptionally deep watersplash. This latter obstacle proved the undoing of several of the riders; in fact, nearly all belt-driven machines experienced trouble after getting through the water. Ladkin Green (Douglas), Strong (Sunbeam), (Norton), and two A.J.S. sidecars showed up well. Thirteen competitors finished the course.

TRADING WITH FORMER ENEMY COUNTRIES.

The following resolution has been passed by the Council of the British Association of Trade and Technical Journals, Limited:

"In view of the expression of opinion by Sir Auckland Geddes, as President of the Board of Trade, regarding the acceptance of advertisements of goods manufactured in late enemy countries. the Council have carefully considered the whole position. They now recommend members to adhere to the adopted policy of the Association not to accept such advertisements for the present, in order to enable British manufacturers to recover their normal working conditions, At the end of the present year (1920) the subject will again be considered, with a view to further advising members on the subject."

The publishers of "The Motor Cycle" readily accept this recommendation, and have, in fact, constantly refused offers of advertisements of German goods.

Hastings, St. Leonard's and Bexhill M.C.C.

The first official run will be held on the 15th inst., and will include a hill-climb. Hon. secretary: Mr. W. F. Thomas, 16, Havelock Road, Hastings.

Bedford and District M.C. and L.C.C.

A reliability trial for the Rudge-Whitworth Cup, over a hundred-mice course, has been arranged for Whit-Monday. Full particulars and entry forms can be obtained from the hon. sec., Mr. H. H. Berrie, Goldington, Bedford.

Stalvbridge and District M.C.

Starting from Bower Fold, Stalybridge, at 10 a.m. on the 16th inst., a reliabilit trial will be held to compete for the Blake Challenge Cup and gold medal. Silver and bronze medals will also be awarded, including a special silver medal for the best performance on a single-geared machine. Full particulars can be obtained from the hou. sec., Mr. G. E. Watts, Balmoral House, Mottram Road, Stalybridge. Entrance fee to date of start, 6s.

Manchester M.C.

The above club held a very well attended and highly successful speed trial at Bill o' Jack's, Greenfield, on the 2nd. The weather was fine, but a strong adverse wind was blowing, and this, coupled with a bad road surface, made the times accomplished very good. Each class was well supported.

Mr. Harry Reed gave an exhibition ride on his 8 Dot J.A.P., being timed over the course at 82 m.p.b.

The results were as follow:

Class 1 (350 c.c.)—1, O. E. Carter; 2, G. Cowley, 3, W. Cottred,—1, E. Bottomley; 2, N. B. Newton; 3, O. E. Najtor, C. Lass 3 (Unlimited)—1, E. Bottomley; 2, O. E. Carter; 3, N. B. Newton, 3, C. E. Najtor, C. Cass 4 (Sidecars, unlimited)—1, E. Smith; 2, H. Taylor; 3, J. Bullought,)—1, E. Smith; 2, H. Taylor; 3, J. Bullought,

N.M.C.F.U. (Coventry).

Starting from Swan Lane, Gosford Green, at 2 p.m., on the 16th inst., a run will be made to Edge Hill.

West Kent M.C.

This club is now on a sound footing, and an interesting programme has been drawn up. On the 15th inst. a hill-climb will be held, competitors meeting at the Bull Hotel, Chiselhurst at 3 p.m.

Luton and South Beds. A.C.

Recently a reliability trial was run from Luton to Cambridge and back, resulting in a win for G. S. Davidson (3½ P. and M. sc.), gold medal, with N. Allbon (2½ Levis) second, silver medal. Thirteen riders won bronze medals for non-stop runs within five minutes of schedule time.

Newcastle and District M.C.C.

This club held a most successful flexibility hill-climb on the 2nd inst. on the main road between Rothbury and Aln-Results-350 c.c, class, Robb (N.U.T.); 600 c.c. class, Armstrong (A.B.C.); unlimited solo, G. Watson (Triumph); sidecar, Baker (Harley-Davidson).

Dorchester M.C.C.

The results of the hill-climb, hold over a 600-yard course on the 4th inst., were as follow: Class I., C. B. Brudenell (8 Enfield sc.), 31½s. Class II., J. Cars-lake (7-9 Indian), 25½s. Class III., W. G. Churchill (4 Verus), 29½s. Class IV., F. J. Blackwell (23 Douglas), 334s.

Wakefield and District M.C.C.

Nineteen competitors started from club headquarters in the 120-mile reliability trial held on the 2nd inst. The results were as follow: 1, E. H. Kitchen (8 Sunbeam sc.), full marks; 2, B. Townend (8 Sunbeam sc.), lost 1 mark; 3, H. Gooder (6 A.J.S. sc.), lost 2 marks.

Keighley M.C.

A hill-climb has been arranged fo Saturday for the Coulton Trophy. contour of the hill has been placed of the notice board at the club, and th hill will be declared to-morrow.

Dunheved (Launceston) and District M.C.

Two interesting competitions recently held by this club. The first too the form of a 15 m.p.h. speed-judgin competition, in which thirty-two compet tors participated. The prize winner were: 1, S. G. Carter; 2, E. J. Johnston 3, J. Philp.

Loughborough and District M.C.C.

A hill-climb is arranged for the 15t inst. on Beacon Hill, Woodhouse Eave All intending competitors should commun cate with the hon, sec., Mr. K. S. Toping, 64, Frederick Street, Loughborough Entrance fee 2s. 6d. Entries close fir.

post Saturday morning.
On the following day most of the Micland clubs will meet in the Loughboroug Market Place at 3 p.m.

Wombwell and District M.C.C.

The results of the inter-club hil climb, recently held in conjunction wit the Wath and District M.C.C., were the Wath and District M.C.C., were ifollow: 275 c.c. class, H. Massey (£ Levis); 550 c.c. class, H. Hincliffe (£ Douglas); 500 c.c. class, J. E. Bellis (£ Rover); 650 c.c. class, C. Diggles Triumph); 750 c.c. class, C. Diggles Triumph); 1.000 c.c. class, M. Cart (8 Imperial-Jap); 650 c.c. class (sid cars), A. J. Haywood (4½ B.S.A. sc. 1,000 c.c. class (sidecars), E. Sayles Enfield sc.): fastest time of the day (Enfield sc.); fastest time of the day, (Diggles (4 Triumph).

HILL-CLIMBING ON A DISUSED ROMAN ROAD.

A scene at the Sheffield and Hallamshire M.C.C. "special" hill-climb held last Saturday on the old road between Chesterfield and Brough. Swamp and flood water caused a good deal of fun, the back wheels of sidecar machines refusing to grip the slimy "road" surface.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," so, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed anvelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Jet Size.

Can you please tell me the most suitable size of jet for an old 23 h.p. Bradbury (about 1908) with a.i.v. and Senspray carburetter —H.D.

The jet size might be anything between 28 and 36. You will have to find the most suitable size by experiment.

Two-stroke Port Timing.

Will you kindly state the correct opening of ports for two-stroke engines? Does the exhaust open fully before the inlet port opens?—E.F.H.

It is impossible to lay down any hard and last figures for the port timing of a two-stroke engine, as so much depends upon the shape of the cylinder ports. The inlet port opens about 40° before the top of the stroke, and the exhaust port opens as the piston nears the bottom of the stroke, usually commencing to open when the crank is about 55° from bottom dead centre. The transfer port is uncovered ew degrees after the exhaust port opens.

Lack of Power.

I have a 1919 5-6 h.p. big single Rudge-Multi, but cannot get enough power out of it to take a sidecar without passenger up the slightest incline, and yet when on the stand it seems to be running well. The magneto is in good order, as I only had it back from the makers the other day. The carburetter (Senspray) is in good order, and I have tried 38, 40, and 42 jets, and find that the 40 answers best. Would it be the magneto timing? I have it timed: Piston the least bit on the down stroke, spark fully retarded, and the points just about to break. The valve timing I have not touched, so that should be in order, and the machine has only done 300 miles since I decarbonised it.—W.A.C.

he details given do not permit a very contact diagnosis to be made. Excessive learance at the exhaust valve tappet legatance at the exhaust valve tappet light have some bearing on the trouble, the ignition timing appears to be in rder, but you can verify it by ascertaing whether the spark occurs when the iston is about 10 to 12 mm. from the top t the compression stroke with the control ally advanced. Do not attempt to climb ills on too high a gear. Pull the gear wer back before the engine commences of slow down, as the great secret with its machine is to keep up the engine evolutions.

Gear Trouble.

I have had my machine stored for two years, and now I cannot get the free engine position of the N.S.U. gear. I can get it into top gear and low gear without trouble, but it will not give free engine. I have tried oil. Can you tell me how to remedy this?—G.H.M.

If you can get both high and low gear with the N.S.U. pulley you must get the free engine position, as this is midway between the two gears, and the high gear must be disengaged before the low gear comes into operation. Try the effect of flushing out with paraffin and relubricating.

Fitting Piston Rings.

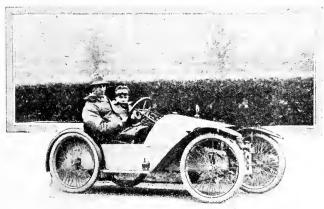

I have a 1913 23 h.p. Douglas motor cycle, which has covered about 15,000 miles. On taking it down for general overhaul, I found the piston rings rather badly worn. I have ordered a set of oversize rings from the makers, and shall be glad if you will enlighten me on the following points: (1.) What gap should the ring have when it is in position on the cylinder? (2.) Would it be sufficient if I make them a dead tight fit in the bottom (i.e., unworn part of the cylinder), as their working position is slightly larger owing to wear?—Mick.

(1.) The piston ring should be fitted in the working part of the cylinder bore, and when in position the gap should not exceed 4-1000ths. (2.) Without knowing the amount of wear in the cylinder it is impossible to say whether it will be satisfactory to make them a dead tight fit in the unworn part.

Running a Scott on Benzole.

In a recent issue I noticed an article on starting the Scott. The writer mentions that he uses benzole, whereas in my experience of this make I find that benzole appears to attack the rubber rings at the base of the cylinders, and new rings have to be fitted after about a fortnight's running. Would, you inform me whether he has had any difficulty with the rubber base rings in the cylinders of his machine from this cause? The makers inform me that they use benzole exclusively at their works, but when I have tried it the results have been as stated.—M.W.W.

The writer of the article in question informs us that he has not experienced the trouble you mention, despite the fact that his machine has now covered well over 3,000 miles, running entirely on benzole. No special preparation has Leen used to protect the cylinder hase rubber rungs, and the cylinders have not yet been renowed.

The Black Prince buckboard in its latest form. The small Union two-stroke engine is now fitted in front instead of on the "running board," as in the early model

A Pillion Riding Difficulty.

1 nave a 1913-1914 Premier 23 h.p. motor cycle. It is quite powerful enough to take a carrier I have a 1913-1914 Premier passenger, but whenever I try
to do so, the cycle immediately
"rears up" on its back wheel. The

saddle is as far forward as possible. Will you please tell me if anything can be done to make "carrier riding" on my machine possible ?-K4.

We have never experienced the trouble to which you refer on any make of machine whatsoever. As the saddle is as far forward as it will go, we can only suggest that you instruct your passenger to sit well forward upon the passenger to sit wen forward upon the carrier, thus bringing the weight as much as possible within the wheelbase. The fitting of T.T. bars might also help matters, as your weight would then be thrown still further towards the front. It is, however, risky to carry a pillion passenger on a machine so balanced.

An Impossible Scheme.

A motor cycle being at present beyond my financial reach, I propose building a motor scooter, or more correctly, a light motor cycle. As my monetary resources are not great, I desire to accomplish this as cheaply as possible. It was my intention to use a gentle-man's 24in, cycle frame and rebraze it so as to drop the down tube to give a lower riding position. The cross-bar will also be dropped, and the engine carried above the bottom bracket. (1.) What would be the cost of the rebrazing involved? (2.) What borse-power engine would you advise me to get (a 2½ to 2½ h.p. two-stroke), and what make? Would a good second-hand engine be preferable? (3.) Would 26 × 1½ in. pedal cycle wheels be strong enough for my purses as the wheels are cheen and the wheels be strong enough for his purpose, as the wheels are cheap and the tyres easily procured (28in. wheels were used in this frame previously, but the 26in. wheels would give a lower riding position). (4.) What would be the characteristics of the cha be the best means of transmission?

I am afraid that the back stays are not wide enough for a belt rim to be bolted on to the back wheel, therefore, in that case, I must confine myself to chain drive. Would it suit to drive from engine to a countershaft, which could be housed in bottom bracket by chain, and thence from countershaft by chain to driving wheel. Is a cush drive essential? (5.) What speed would it be advisable to gear down to, owing to the bad roads in the Midlands, and on account of the h.p. of the engine used; and what number of teeth in the gear wheels should I require? (6.) Would a good pedal cycle chain do for the drive? SCOOTERITE.

Under no circumstances would we recommend that you endeavour to construct a machine such as you describe. Pedal a machine such as you describe. Penal cycle frame fittings and transmission are not strong enough to withstand the strain imposed by a 2\frac{3}{2} h.p. engine. Moreover, you would require wheels fitted with tyres of at least 2in. section, and preferably of 2\frac{1}{2}in. You would probably find it cheaper to obtain a second-hand 24 or 23 h.p. motor cycle.

Combined Footboard and Mudshield.

We recently published particulars of We recently published particulars of a combined footboard and mudshield, marketed by Messrs. Henry, Duke' and Co., and have since been informed by them that Messrs. C. W. Motor Co., 209, Broadway, Edgware Road, West Hendon, N.W., have been appointed sole selling agents for this accessory.

Sunbeam Repairs in London.

Messrs. John Marston, Ltd., manufacturers of the Sunbeam motor cycles, inform us that their repairs department at 57, Holborn Viaduct, London, E.C.I, has recently been developed and is now able to deal with the repair, overhaul, and renovation of Sunbeam motor cycles and sidecar outfits promptly and satisfactorily.

Brico Piston Rings.

An interesting little leaflet, dealing with the question of piston rings generally, and the Brico in particular, has recently come to hand. These rings are made to suit all requirements, and the makers, The British Piston Ring Co., Ltd., of Coventry, will be pleased to supply them to garages and dealers who handle motor cycle repairs.

Dunhill Sidecars.

A correspondent writes that he took his Scott through the recent London-Land's End Trial fitted with a Dunhill lightweight sporting sidecar, and though he quite expected "something to go," the latter survived the ordeal satisfactorily. This speaks well for the springing and chassis, considering the condition of the roads traversed.

Salvage.

A Palmer landing wheel has recently been picked up at Clacton. It is believed to be part of a Bristol Fighter lost at sea during the war. Apparently the machine had been in the water many months, as the spokes of the wheel had rusted through, separating the rim from the hub. The tyre, being still inflated, rose to the surface, and was washed ashore.

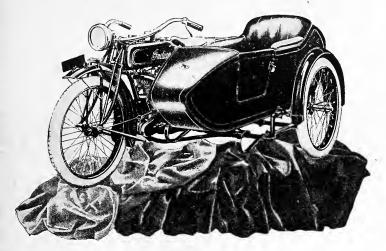

G.W.K. (1919), Ltd.

Messrs. G.W.K., Ltd., Cordwalles Works, Maidenhead, have recently been taken over by a new company—G.W.K. (1919), Ltd. The original company has therefore been finally wound up, the usual notices to this effect having already been published. As often happens in these cases, the notice has been misunderstood by some people, and the new company is anxious to point out that the notice in question referred to the old company, and not to the present one.

On Velvet

You are "on velvet" when you ride the Spring Frame Powerplus Indian.

Your first sensation is that the roads are strangely smooth and even, and that you are gliding along without fuss or effort.

You will find, too, that you are "on velvet" as regards economical running and freedom from mechanical troubles.

You have, in fact, the refinements and comfort of a high-powered car with an equal range of speeds.

POWERPLUS COMBINATION, Complete with Dynamo Lighting and Speedometer, £223 14 O. Delivery in about three weeks.

Retain the Fuel Tax!

THE storm of criticism which has been aroused by the proposed new taxation is not likely to be without some practical result. All motor cyclists are agreed that the only fair method of taxation is by imposing a duty on fuel so that the greatest sum is paid by the man who uses the road most. Originally, the Advisory Committee on Motor Taxation favoured a fuel tax, but later abandoned the idea, apparently on the grounds that evasions were not only possible, but already an actual fact.

Some grounds for this assumption were provided by figures available at the time when the Committee were considering the question; but later information elicited from the Chancellor of the Exchequer by Sir William Joynson-Hicks shows that the conditions ruling at the time were fictitious, and that there would now appear to be no reason for the change of policy.

The possible use of paraffin as a motor fuel has always been a stumbling-block to the introduction of a fuel tax, since it would be obviously unfair to tax fuel used mainly for illumination, and it might be difficult to determine the ultimate destination and use of paraffin sold in quantities. The difficulty is, however, not insuperable, and in any case the use of paraffin for road vehicles would be very small if supplies of better fuel are available.

No road user will object to increased taxation, provided that the proceeds go towards road improvements, but it is essential that the tax shall be fairly distributed, and shall be equal both for the working man who may own a secondhand machine and sidecar and have opportunities for using it on only a few occasions in the year and for the more fortunate owner of a £200 outfit who covers perhaps fifteen to twenty thousand miles in the same period.

So far, the only form of taxation which accomplishes this desirable end is the fuel tax,

and it is to be hoped that all motorists will do their bit by urging its adoption through their Parliamentary representatives and by supporting the proposal in all possible ways. If motorists and motoring organisations will only show a combined front, there is reason to hope that the fuel tax may still be adopted.

Let us have Unanimity!

T Sheffield last Saturday matters of momentous import to the controlling body of the pastime were discussed by representatives of the motor cycle clubs in the East Midland centre, as reported The A.C.U. representative on another page. who was present admitted that the indignation of the Northern clubmen was justifiable, and implied that, by allowing an unfortunate clashing of dates between important and similar events of the Northern and Southern clubs, a grave mistake had been made. In view of such an admission, little more need be said on the matter, but we would urge that the A.C.U. should endeavour to eradicate the bitter feeling which has arisen. At the meeting in question, a complete repudiation by the clubs of their affiliation to the governing body and a revival of the Northern Union of Motor Cyclists was freely mooted.

Such a happening (repeating past history) should be avoided at all costs. The Northern clubs are extremely powerful numerically and virile in spirit; the membership comprises keen and hard riders for the most part singularly free from trade interests. There is no doubt that the Northern Union, if revived, would find the men and means to establish itself firmly and quickly, but, despite the fact that our support will always be given to sporting motor cyclists under whatever flag, we strongly deprecate any action which will tend to multiplicity of control. In this case the amende honorable is clearly indicated-may we hope that the Auto Cycle

KIRKSTONE PASS IN THE LONDON-EDINBURGH RUN.

The First Non-stop Section in the Annual M.C.C. London-Edinburgh Run, Friday and Sat., 21st and 22nd inst

START: Old Gate House, Highgate, 8 p.m., Friday, May 21st. FINISH: Edinburgh, 7.50 p.m., Saturday. DISTANCE: 410 miles. CONTROLS: Grantham, Ilkley, Patterdale, Moffat.

Edinburgh.

OBSERVED HILLS: Kirkstone Pass and Moffat to "source of Tweed."

ROUTE: This year a new and difficult section of route is included. After journeying along the Great North Road to a point six miles beyond Aberford, the route passes through West Yorkshire and the Lake District. The competitors are due at Kirkstone Pass just before noon on Saturday.

The Rear Light Question.

7F it is taken for granted that some form of rear warning signal is essential, I personally see no possible objection to a red reflex mirror of good quality. I frankly cannot see why cyclists object to it, or why motorists should demand anything more. But there is an even cheaper and simpler device, which is almost as efficient. Some years ago a deaf cyclist was accidentally killed on the road as the result of his infirmity, and there was an outcry in the press, in which the class agitation between cyclist and motorist did not arise, and the dangers were considered on their merits. It was freely proposed that deaf cyclists should be forced by law to carry a small white disc or diamond on the rear of their machines, and a very few people adopted the suggestion. Such a disc or diamond would only cost a few pence, and I well remember how easily and quickly head lamps of quite moderate power picked up these signals.

Choked Pilot Jet.

If T is not easy to see how the pilot jet of a Binks carburetter can become obstructed. I have owned a number of these carburetters, which are easy to-tune and delicious in operation; but microscopic as the ooo jets are, I have never had one choke. The petrol inflow is guarded by a very closeknit gauze filter, integral with the carburetter; and on the Scott machine the petrol outflow from the tank is further guarded by a second filter, so designed that it cannot possibly get stopped up. It is continuously washed by the petrol swishing about inside the tank, and is so long that if any filth should lodge against it, the upper part of the gauze would still be available for the exit of spirit.

The Cost of Living.

ARIOUS Tory highbrows write to The Times apropos of the alleged high cost of living, and argue from the catering expenditure at various schools and institutions that the cost of living has not gone up anything like 100%, as the trade unions allege. Evidently these gentry do not ride motor cycles. I suppose that if one substitutes margarine for butter, and eats very little meat, housekeeping costs may be kept within nodding distance of pre-war figures. But no such economies are possible in the motor cycling aspects of existence. I strolled into a local agent's the other day. His stock consisted of two good baby two-strokes, and a little-known 234 h.p. four-stroke; it would have taken over £270 to buy the trio. In the industrial homes round my nouse a very curious phase of budgeting is perceptible. The young bachelors are having the time of their lives, and lots of lads who could perhaps barely have afforded

a push bicycle or gramophone in 1914 are now paying fancy prices for motor cycles. Meanwhile, the married workmen, with families of school age, are hard pressed to make ends meet, and are obviously living less comfortably than they did before the war. This curious condition of affairs is bound to have sociological consequences. It may discourage matrimony; or it may interfere with the "equal pay for equal work" doctrine, and lead to some wage differentiation between the bachelor and the Benedict.

Sprung Carriers.

Y colleague "Chinook" has tested most types of rear springing, and his mature conclusions are that (a) a sprung carrier can hardly be dispensed with, and (b) that the springing of the rear mudguard is hardly desirable because of the bad appearance created by the wide clearance, and the risk of heavy mud accumulations inside the guard. My recent riding has been distributed over three machines, all of $3\frac{1}{2}$ h.p., and possessing the following patterns of stern portion:

Rigid rear frame, 2½in. tyre.
 Rigid rear frame, 3in. tyre.

3. Sprung rear frame (including guard and carrier), 21in. tyre.

The first was frankly rotten. It bumped me atrociously. The toolbags demanded very meticulous packing, which is a vast nuisance after an irritating roadside stoppage. Any luggage stacked on the carrier was apt to come adrift, unless secured by parasangs of stout straps, hauled taut with a foot against the carrier; no sane man would store any fragile luggage, such as a camera. on such a platform.

The second machine was not a bad compromise. Very rarely did my anatomy wince under a bad jolt from the rear wheel, as the light car tyre was always run soft, and swallowed up 80% of the average jar. Luggage possessed fair adhesion to the unsprung carrier. The toolbags always did a modest jazz band effect; but if, the toolbag had been mounted where I think it should be mounted (on top of the tank), I should be tolerably satisfied with this layout. In fact, I commend it as a very passable substitute for rear springing, always provided the tools are shifted to the tank top.

The third machine is technically perfect. I never found that the rear mudguard picked up enough dirt to foul the tyre, although I ride over far softer and wetter roads than most of our readers. I agree with "Chinook" that the wide clearance looks ugly when the machine is unmounted; I do not know that this matters very much. My sole criticism on this design is that it chanced to be exceptionally heavy.

Three Heroes.

Y postbag has brought claims from three motor cyclists who have performed or approached the feat of driving a pair of machines, which proved too much for me personally. A Lisburn rider has driven a Scott, leading a second machine, when sent by a garage to fetch in a breakdown. A Barnsley reader on one occasion pedalled a motor cycle four miles whilst leading a push bicycle. I can only award him a putty medal, because I judge that the push bicycle had an open frame, and know that love accounts for many vagaries; personally, I would rather have broken off the engagement. Another hearty lad, hailing from Thames Ditton, actually drove a 7 h.p. Indian twelve miles with a passenger on the carrier

whilst leading 231 h.p. Calthorpe-Jap in free engine. Who says England is decadent, or that anglers hold the championship 3 8 ? [Hush. -ED.]

Oil . Storage on Scott Machines.

7-ILL some genial correspondent shrewd me tips for (a) ascertaining how much oil remains in the reservoir tubes of a Scott machine? (b) replenishing the aforesaid tubes rapidly? We all regret that Scotts are not competing in the 1920 T.T.phenomenal their corner - work has always been one of the chief sensations of the Manx week; but I shall

have a special reason for dogging them in the island next year-I shall watch keenly to see how they do their oil replenishments. If memory does not trick me, they generally use a colossal syringe, the beak of which fits the 1 mm. hole in the filler spout just in front of the saddle tube. If this is so, I shall wait till the Scott mécaniciens are craning their necks to see their first string pass on his last lap—and then I shall slip their biggest syringe down the leg of my trousers. That is, unless some kindly reader imparts a wrinkle which can cure me of hankering for a T.T.

Anyhow, I am now quite fed up with hearing each globule of oil say "glug!" as it overcomes the air resistance in the above mentioned lilliputian orifice. At the same time it seems rather futile to desaddle the machine every time it wants a lick of oil, but up to the present I can think of nothing else.

Aviation Spirit.

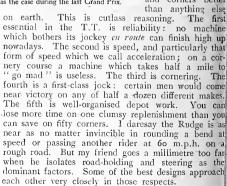

CINCE I do not keep sidecars, and since the road from my gate slopes gently downhill, I amfortunately situated when a sticky engine has to be started. A brief push on middle gear is my usual method, and it never fails, even on the heavy petrol which economy compels most of us to use. A friend of mine who has an 8 h.p. outfit, which he is too lazy to maintain in perfect tune, obtains similar facility by the aid of Aviation spirit. He bought one can of this costly .680 stuff last autumn, and reserves it strictly for use in his doping gun. His compression is sloppy, his carburation all over the shop, and his ignition has lost its pristine fervour after several thousand miles of work. But one squirt of the

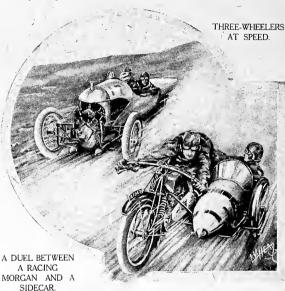

Aviation spirit ensures a first time start on the kicker, and the tip may be of interest to other

born-tireds.

THE opinion is advanced by a correspondent that success in the T.T. is absolute proof that the roadholding and steering qualities of a machine are faultless, since victory hinges absolutely on the number of seconds which can be saved by taking additional risks on the numerous corners with which the course abounds. It follows, since the Rudge won in 1914, that the Rudge (of which he is a delighted owner) steers and corners better than anything else

If these types of vehicles are ever entered for a T.T. event in the Isle of Man, some spectacular cornering may be witnessed, as was the case during the last Grand Prix.

HILL HUNTING for a ONE-DAY TRIAL IN LAKELAND.

By GEORGE D. ABRAHAM,

Author of "The Complete Mountaineer," "Motor Ways in Lakeland,"
"On Alpine Heights and British Crags," etc., etc.

THIS treacherous spring has made many motoring plans "gang aft agley," especially in Lakeland, where record rainfalls have been the rule. Thus, with the barometer bobbing up and down like a new spring frame on Honister, there seemed small chance of the arrangements for a day amongst the hills coming to fruition. However, just as it is darkest before the dawn, so may it be dampest before the drought, and three days and nights of sodden downnour culminated in a glorious morning of sunny splendour. Under such conditions a large party of northern enthusiasts foregathered in Keswick, intent on exploring and settling details of the route for the one day trial-an open event which is to be the most important motoring meet in Lakeland this year. The date fixed is Saturday, July 17th. The A.C.U. approved the idea, and, under the keenly practical organisation of the Cumberland Motor Cycling Club, the trial will doubtless eclipse anything of the kind ever held in the land of craggy peak and gleaming waters. The world strife of the last five years has affected little this land of mountain peace, and, on the whole, compared with the rest of England, the roads are in excellent condition, the by-roads being better than in pre-war days, -

Bound for a Notorious Hill,

Realising these details to the full, we set our faces southwards from the Lakeland metropolis amidst a goodly crowd of machines, mostly recent models. Some were suitable, and some perchance unsuitable for the work in hand, but there would be a keen pleasure in comparing their behaviour on mountain roads with the doings of former times. Our main objective was Blea Tarn Pass, for there was a certain difference of opinion amongst the officials regarding the inclusion of the notorious hill in the coming trial. Above all this had to be settled, and other ideas of the "ultra-freakites" required decision.

On perfect roads we mounted over Castlerigg, swung down the depths of Naddle, and away past the larching shores of Thirlmere, everything seeming strangely spring-cleaned and fresh after weeks of downpour. Along the straights below Dunmail Raise dust even began to appear amongst the clamorous motley of machines, and, seated comfortably in the leading vehicle, one was thankful that special orders had been given for all followers to keep behind the leader. Former experience had taught that thus only could the party be kept together. Despite this, at Grasmere certain sections were missing. Later in the day, some appeared at lunch time, others at tea, and one machine failed altogether to find the rest of the party.

Nearing the summit of Kirlsstone Pass from Amhleside. The well-known hill is in exceptionally good condition, and the machines are seen on the steepest section of "the struggle" — a gradient o. I in 4. The London-Edinburgh route includes this ascent.

Red Bank was the first real hill visited. With the speedmen restrained in the narrow road by the leading car, there was ample time to enjoy the slow, winding approach through sunny glades, where primroses gleamed lush in-beechen shades, and graceful birches dipped their emerald tassels over the mossy walls. Then came the usual crush at the foot of the climb; but, after the camera man had discovered a stance, the climbers sped upwards in strenuous bunches with the sidecars well ahead. Red Bank appeared to have almost lost its terrors for modern motor folk, and every machine made a good ascent. Except for a few stones on the final patch, the surface was superexcellent for such a gradient, and amongst the sidecars a new Matchless outfit made a capital show. A little Clyno was specially fast on the lower sections, whilst, thanks to skilful driving, a highly-geared Zenith surprised the pessimists.

In the Land of the Lake Poets.

With appetites whetted by success, there was slight lingering on the crest of Red-Bank to enjoy that glorious prospect over "Grasmere's peaceful vale." Thus there was an amusing breakaway by the two-wheelers, and soon we were speeding down the complicated route into Langdale with lost riders emerging from most unexpected side roads. However, in due course most arrived at Skelwith Bridge, where the elimb began, and the growing noise below warned those of us up above that the show was about to begin. Of course, for the "old hand," Foolstep has lost much of its grip, and T. Rutherford, ever to the fore on such

At the summit of Blea Tarn Pass with the lofty Langdale Pikes in the background.

A group of the successful riders who reached the top of this notorious Pass from

Hill Hunting for a One-day Trial in Lakeland .-

occasions, showed how it should be done on a 3½ h.p. Sunbeam. On his 3½ h.p. N.U.T. an almost too speedy climb was made by T. Gibson, the captain and trials secretary of the Cumberland Club. R. Havnes, on a 4 h.p. Triumph, solved the problem

suddenly, rather several whilst B.S.A.'s climbed strongly; and of the small machines a 21/2 h.p. Clyno, neatly piloted by R. Pape, reached the summit after a midway swerve. A 6 h.p. A.J.S. sidecar, driven by Capt. T. D. Craig, climbed steadily on the low gear throughout, and a new 8 h.p. Matchless, in charge of T. B. Westmorland, and carrying a very active : passenger, also stuck well to the work in hand. Nevertheless, not all the others managed the climb at the first attempt, and in any trial, Foolstep, with its sudden, sharp turn revealing a startling opposing gradient, must be always a sporting problem.

Then came a quiet change in a delightful run up the length of

Langdale, through the grey hamlet of Chapel Stile, and on into the depths of the dale with the craggy peaks of Pike o Stickle and Harrison Stickle loom ing ahead and gathering in grandeur on neare approach. At the welcome Nex Hotel at Dungeon Ghyll, many los units of the part were recovered and at lunch timwe had a wonder

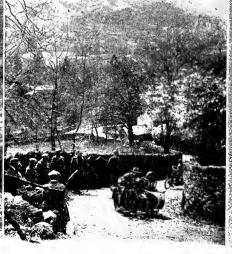

ful exhibition o

what can be don

A pretty peep below Foolstep, near Skelwith Bridge. The Sunbeam outfit came speedily up to the first corner, and after a skilful gear change reached the summit at slow speed.

A tough struggle on the steep corners on Foolstep. The 1920 8 h.p. Matchless made a capital climb up the short but stiff hill which will be included in the Lakeland One Day Trial. The gradient is 1 in 3½.

at an out-of-the-world English inn when between thirty and forty unexpected guests arrive.

It was noticed that many improvements have been made to the road along Langdale, but these ended completely at the foot of Blea Tarn Pass.

The double corners about a third of the full height of the pass were obviously the crux of the climb, and there we had a fine lookout over the scene of operations. Far below, the crowd gathered thickly on the white ribbon of roadway through the green meadows. Then, our signal being given, the roar of engines was wafted aloft, and three of four dark specks sped away from the crowd and up towards the heights.

The B.S.A. ploughed powerfully upwards despite being carried into the roughest surface, and Haynes on his 4 h.p. Triumph, in avoiding the same course, went to the other extreme. He performed some wonderful passing on big boulders and rocks which lined the left-hand side of the roadway, but surmounted the boisterous bumping with no damage to his crank case. Ar excellent route was picked by Pape on the little 2½ h.p. Clyno, which made one of the best ascents of the day. After T. Storey on a 2¾ h.p. A.J.S., and Huntrods on his 3½ h.p. Ariel three-speed had made things lively for the spectators; the Matchess was the first of the sidecars to make the attack.

The ascent of Capt. Craig's 6 h.p. A.J.S. outfit, driven by J. J. Dias, would rank as the best performance of the day on Blea Tarn Pass.

Commendable Performances.

Macdonald's Sunbeam combination, driven by T. Rutherford, also reached the summit, and Gibson's N.U.T. gave a decidedly good exhibition. A noticeable performance was that of Helder's new Regent machine, which is fitted with a 5-7 h.p. Coventry Victor engine and three-speed gear.

Then the remaining machines turned down the valley to Ambleside, and some of the mere spectators walked over the crest of the pass, and regained the welcome car, which had travelled round to the Little Langdale side by Ullet Nest Hill.

After the reunion at Ambleside, the steep side of Kirkstone Pass was climbed, on which were derelict evidences that the Pass, with its long, steady gradients of \mathbf{r} in $4\frac{V_2}{2}$, has not lost its grip even for modern motors.

Excellent Surfaces.

The well-known hill was in excellent condition; never in the writer's experience has the pass on both sides possessed such excellent surfaces. During the halt on the sunmit, dark clouds closed down over the heights, and through mountain gloom the way to Patterdale and Ullswater was followed until the only bad piece of main road met with during the day was encountered by the lake shore. Here the various contingents parted company, and the westward-bound travellers were chased homewards over the wild and desolate moors of Matterdale by a wind-driven rainstorm.

Finally, it may be mentioned with certainty that Blea Tarn Pass from Great Langdale will not be included in the Lakeland One Day Trial. In fact, the hills will be so selected that, after starting from Carlisle; two long non-stop runs, with midway lunch at Keswick, can be made during the day. Kirkstone will be climbed from both sides, and some new hills in Little Langdale will very likely be used in the approach to Blea Tarn Pass from the eastward side. The descent of the steep side would be an innovation in any trial. In northern Lakeland some new inclines may be included, as well as Whinlatter Pass and Buttermere Hause.

COUPLE of cycle car patents open the present series. Capt. Viner and A. H. Colley have devised a novel transmission, which embodies a really ingenious substitute for a differential axle. Mr. G. H. Jones protects a very cheap, light, and sturdy form of solid back axle, devised principally in the interests of belt-driven cycle cars with central drive. The triangulation of the radius

and tie-rods deserves attention, as also the strut which links these four rods together. and serves as the mounting for a brake shoe working in the pulley groove.

An Enclosed Motor Cycle.

Mr. E. C. F. Oakley is a stranger to me, but, by applying the methods of Sherlock Holmes, I deduce that he is an elderly engineer with a poor circulation, who anxious to retire from business on a com-petency at an early date. He is trying to secure a master patent

on the type of motor cycle which we all dream of, but which none of us have yet seen. In other words, he has de-vised a broad specification of a boatshaped motor bicycle in which the frame

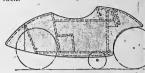

Capt. I. B. Viner

and A. H. Colley's

cycle car.

is integral with a streamlined bodv. Such a machine affords complete pro-tection from the weather, and can be hosed clean in a few minutes after a London - Exeter run without recourse to a hoe, a bristle brush, and a bathful of paraffin. The patentee is prepared to make the main structure of wood, of channel steel, or pressed steel. The streamlined covering-will vary between plywood, aeroplane fabric, sheet aluminium, and steel pressings, and the construction of the internal cross members must, of course, vary according as the ex-

ternal skin adds strength to the structure or demands support from it. Small trailing wheels are suggested as the means of propping the machine when stationary. It is common knowledge that such a motor bicycle will arouse tremendous interest as soon as it is commercially produced at a reasonable price and weight. It could undoubtedly sweep the board so far as utilitarian bad weather riding is of cerned. I hope Mr. Oakley will go ahea and in the name of many much-enduri mudlarkers with cold feet I wish b

E. C. F. Oakley's enclosed motor cycle. No. 135,907. 29/11/18.

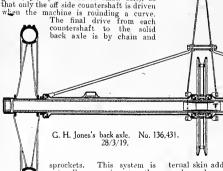

Mr. H. Taylor, of Penrith, has protec a new version of the so-called "flov pot" system of friction drive, which other forms has already figured, I belia on a Mead and Deakin cycle car, and the very early days, on a motor bicy the name of which I have forgotten. gear is distinctly ingenious, and embo several technical advantages. wheel forms the driving member, am conically bored out from 5in. diamete the front to 18in. diameter at the r The boring is taper except for the inch or two towards the rear, where, parallel. The driven disc is of sim contour tapered towards the front, parallel at the rear. The driven dis parallel at the rear. In a divien dis-keyed to the propeller-shaft, and thei is a reduction of about 12 to 1 at the be-gears in the back axie. On bottom in the tapered portions of the two "flot-pot discs" jam into each other, an' direct drive of the ordinary friction chain type is given. As the gear is raised to wheel, and a peculiar mounting crile permits the driven taper to make role contact with the taper in the flywlow

H. Taylor's variable gear. No. 131,43

For top gear the parallel part of he driven disc is put in contact with he parallel bore of the flywheel. The degree gives direct drive on bottom gear, abs of end thrust on top gear, and practi ly eliminates the "rubbing action" in countered when a widefaced flat dis set at right angles to another flat st. The cradle, telescopic propeller-shaft, and universal joints, which permits the dring shaft to assume the necessary and lar positions, are not unduly completor costly to make. I wonder, hower, if a flywheel 18in, wide can be add sufficiently strong at a reasonable we at

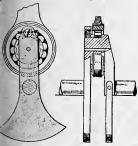

As the diagram indicates, the first item of the drive is by friction discs. From the shaft which carries the driven disc a flat belt runs to two countershafts mounted in alignment. The front belt mounted in alignment. The front belt pulley is wide, and each countershaft carries a narrow pulley; thus, the belt may either drive both countershafts simultaneously or each countershaft separately. The belt striking gear is automatically operated by the steering gear (e.g., by a chain or small belt), so that only the off side countershaft is driven when the machine is remidire a course.

naturally superior to the familiar method of driving one wheel only. The proweakness of friction-cum-belt vernal weakness of inclinicum-bett drives does not arise, as the top gear reduction is obtained via the chains and sprockets. I understand that the patentees are willing to negotiate with manufacturers.

Roller Bearing Crankshaft.

If the making of crankshafts there is end. When Granville Bradshaw tented his roller bearing shaft, in which oconrods were threaded over the ink, and the rollers were located in a race by split collars, he probably ped to secure a master patent. But

D. A. Pearson's crankshaft and bearings. No. 134,970. 23/11/18.

nost every month produces some fresh ain wave on broadly similar lines. For ample, Mr. D. A. Pearson attains a ry narrow crank pin indeed. Like r. Bradshaw, he threads his banjo mrods into position; but he dispenses th split collars by drilling a hole in one le of the crank, through which the llers are poked into position. If unterweights are used, one of them is de detachable, to permit the conrod be threaded over the crank. The hole sealed by a screwed plug, which is ked by a split pin.

"Vermicular" Construction.

The critics who consider the average 20 machine too conventional will make such complaint of the new frame procted by MM. Goudard and Mennesson, Neuilly. It combines the 'American tion of good production qualities with l ugliness which America at its worst s never surpassed. As the drawing dicates, the frame is constructed of a ugle tube of large-diameter, which also rms the fuel tank. A luggage carrier d footplates are supported on the horintal portion of the frame amidships. ist in front of the back wheel the single be in twice bent at right angles to clear e wheel, which possesses a "live" stub le, carried by suitable bearings, and iven by the engine. The latter is cured by stirrup irons to the single tube the frame. Astern of the back axle, e single tube is bent upwards at an

angle, and the saddle is mounted on a horizontal pin supported by the end of the tube. As the engine is mounted out of the centre on the off side, the rider is seated out of centre on the near side; but the inventors have made no attempt to balance the total weight between the wheels, though most of it is inside the wheelbase.

An "Asperity" Damper.

I approach the next item, protected by Messrs. Alldays and Onions in con-junction with A. H. Johnson, with great prejudices in its favour. The preamble to the technical description employs a delicious Tudoresque phrase which no journalist can resist, for it speaks of the "asperities" of the road: no reference to the Kingston police is intended. The main idea of the fork is to keep the axis of the hub as nearly as possible in a line with the axis of the steering head. This

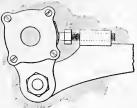

girder fork. The radial motion of these levers is damped by tension and compression springs, as shown, the lower springs being suitably fork is not pretty, as The illustrated, but it should give excellent

A Morgan Device.

steering and insulation.

H. F. S. Morgan, of Runabout fame, protects a simple method of chain adjustment. As the sketch suggests, the bearings are carried in short arms pivoted to the frame. The radial position of the arms (and therefore the chain tension) is controlled by a threaded bolt, threaded lug, and locknut. Where this construc-

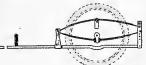

H. F. S. Morgan's chain adjustment. No. 135,789. 28/11/18.

tion is adopted, the brake lever supports will be provided with an equivalent adjustment, consisting of a slot-and-nut mounting.

Sidecar Wheel Spring.

Mr. J. Goulding, an Australian rider, propounds an adjustably sprung sidecar wheel. He uses two-point suspension for the sidecar chassis, the front connection being rigid, whilst the rear fixing takes the form of a horizontal hinge. The axle of the sidecar wheel is carried by a halfelliptic spring, secured to a pillar at its front end, while the rear end is attached to a pivoted vertical link. This link is to a pivoted vertical link. This link is drilled with a number of holes, and the suspension is adjusted by shifting the spring pin from hole to hole according to the load in use. A second pack of springs

J. Goulding's sprung sidecar wheel, No. 134,981. 27/11/18.

completes a full elliptic, the upper half serving to carry the sidecar body. The upper half-elliptic is attached at its forward end to the pillar, and is shackled to the link at its rear end. The inner side of the body is supported on a second full elliptic spring, mounted on the side-car chassis in the usual way.

A Lady's Invention.

Mary Parker, of Lancaster, has protected a neat little handle-bar muff, which can be attached to the grips without the use of tools. A spring clip of the C

Mary E. Parker's handle-bar muff. No. 132,962. 2/1/19.

type forms the means of attachment. This clip is riveted to a flanged ring carrying the frame and fur muff. The inner end of the muff is formed from a rubber disc.

A Well-organised Trial that attracted Considerable Public Interest.

VERY considerable interest was roused by the first annual speed contest of the Edinburgh and District Motor Club. This took place at Lang Wang-over an undulating course of 765 yards. There must have been at least 1,000 spectators present, and the marshals had no little difficulty in controlling the congested traffic which lined the road for several hundred yards behind the starting point.

It is rather surprising that while such events draw these huge gatherings of motor cyclists mounted on apparently "hot-stuff" machines of every type, such a small percentage ever think of supporting the pastine by actually participating, with the result that the amateur classes are usually deadly dull compared with the open events.

The contest was successfully handled, though it certainly seems that the very able Edinburgh committee delight in choosing the bleakest spots in all their bleak hills for these somewhat draughty proceedings!

The scooter classes did not materialise, but the open lightweight class for machines not exceeding \$50 c.c. was we'd patronised. That A. H. and J. R. Alexander would put up the fastest times was a foregone conclusion, as their 23 Douglas machines were in fine order for such an event. The former rider completed the course in 33s., beating his brother by 1s. H. M. Batten mounted on a 23 h.p. Verus-Blackburne, was third on the list at 38s.

In the amateur event for machines of the same size H. M. Batten was fastest in the class by 3s., his time being exact as before; while W. Alexander (2½ A.J. claimed second place, the remain amateurs being several seconds slow. The exceptionally strong head with these small machines sorely. In the 351 to 600 cc. class, Cunni ham, mounted on an overhead valve.

In the 551 to 500 c.c. class, Cunmiham, mounted on an overhead valve Douglas, enlivened the proceedings of burring through the long lines of spe tors in 28½s., and there was much spe lation as to whether Claude Duncan Norton), who did so well in the Redst Rig hill-climb, would beat this. Consiable excitement was manifested w Duncan was twice sent back owing to failure of the electrical apparatus register his time. On the third atten however, the stop watch showed a read of 272 seconds—the fastest in the cl

R. Fairley (7.9 Excelsior), who was beaten by asec. by R. Boyack.

R. Boyack on an o.h v. racing Bat-Jap. He made fastest time of the day.

Claude Duncan (32 Norton), who won the amateur class.

The solo event up to 1,000 c.c. (open) a naturally the most impressive of the y, and it was particularly gratifying to a the keen enthusiasm of the spectators. a times were:

Boyack and Fairley crossed the line at a very high speed, and overshot the steep rise with which the course terminated, while nervous spectators were somewhat horrified at the "speed wobble" that in each case took possession of their steering instantly the throttles were closed. Boyack was evidently out to establish fastest time of the day, and his performances are certainly very fine for an amateur rider, while Fairley is a most promising young speed man.

One of Macrae's compression taps jolted open, and A. Lindsay was riding an almost new machine taken from stock.

The tie between Boyack and Fairley was next run off, their times being Boyack 22.2s. and Fairley 22.4s., so that Boyack won by .2 second, truly a narrow margin! The two returned to the slatter amidst the cheers of the spectators.

In the unlimited sidecars, Geo. Grinton (Harley-Davidson) appears to have won easily, his time being 31.4s. Fred Hutchison, the club secretary, riding an Indian, secured an honourable second place by achieving the end in 33.4s., R. Macrae being 36.0 and J. Alexander 37.6, while the remaining competitors were considerably slower.

A SCAVENGING TWO-STROKE.

Piston Rings and Carburetter Eliminated in an Original Design.

'HE engine we illustrate was designed by Capt. R. A. Williams, R. E., of 6, Burlington Road, Dublin, whilst Active Service in France. The primary ject was to obtain in the two-stroke at efficiency and petrol economy that is ally associated with the four-stroke rine.

Due of the chief reasons of the lower rmal efficiency of the two-stroke, as npared with the four-stroke engine, is the exhaust is imperfectly carried before the incoming gases are forced to the cylinder. The result is that ne amount of the burnt-gas remains aind, and also a certain proportion of tresh mixture is swept out with the

in large stationary two-stroke engines s difficulty is overcome by "scaveng-," the cylinder with cold air immedialy after the exhaust ports have been med, leaving the cylinder free of burnt see before the exhaust ports finally close d the gas inlets begin to open. A nilar principle is applied to the engine der review.

supply is sprayed into the cylinder past the variable aperture needle valve, and the third part of the port is exposed, allowing the air remaining in the crank case to sweep the petrol cloud over the hot spot piston deflector into the body of the cylinder.

Pressure-fed Fuel.

It is intended that the main fuel supply be kept in a tank under a pressure of about 6 lb. per square inch by means of a small hand pump, to be operated as required. The fuel flows from the tank, past a non-return ball valve into the barrel containing the needle valve, where it is compressed and finally forced into the cylinder at the right moment as already described.

Arrangements are now being made to build a three-cylinder engine of this type, and two types of piston are to be used—the ordinary ring type and a new design of ringless piston, as shown in the illus-

tration. In view of the interest that has been shown in the "obturator," this new piston will prove interesting when the results of the tests are available. It will be noted that the piston consists of two very light steel cups partially filled with aluminum pieces and bolted back to back by a steel piece carrying the gudgeon pin. The steel cups are split vertically in such a way that the explosion and pressure of the gases are utilised to expand them. As the pressure of the gas decreases with the movement of the piston, it is claimed that the pressure of the cups against the cylinder wall decreases and so reduces the wall friction at the period when the piston is moving at its high speeds.

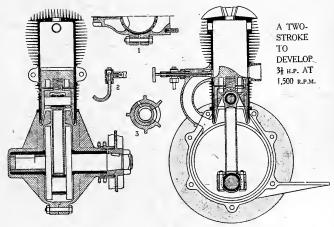

The engine shown has a bore and stroke of 70 and 90 mm. respectively, and, we are informed, develops $3\frac{1}{2}$ h.p. at 1,500

It is perhaps unnecessary to state that the design is fully covered by patents.

Ports in Crankshaft.

lo understand the construction of the time it is advisable to study the cycle operations. On the upstroke of the ton air alone is sucked into the crank under via a port, and a hollow shaft, e rotation of the shaft closes this port soon as the piston begins to descend, npressing the air now contained in the nik chamber. When the air in the under is at ahout 75% of full compress, a very small percentage of it is wed to pass into the fuel pipe through a hollow crankshaft heaving. This raises pressure of the petrol contained in the ready to inject the fuel into the linder on the uncovering of the inlet the

Near the end of the exhaust etroke the exhaust port is uncovered, and allows a burnt gases to exhaust to atmosphere. In the further on (three millimetres) the nee-part inter port begins to open. The st part of the port allows a blast of air me from the crank chamber to pass to the cylinder to form a cushion or er of air before the second part of the the lading from the petrol pipe, is covered. At this point the petrol

Some New Records. The Latest in Sidecars. The Ace being Tested. 1920 Excelsion now Blue. A V Four-cylinder Machine.

THAT venerable old gentleman, name o' Father Time, he of the flowing robe, chin adornment and the grass cutter, has of late been treated in a rough and unseemly manner by motor cyclists here. These more-or-less-United States may be dry, but the fact does not keep an internal combustion engine from functioning. Every event this season on track or road has resulted in a battering of the former record.

The crowning achievement in these wild The crowning achievement in these wild bursts of speed is the amazing times hung up by Gene Walker, who, Indian mounted, covered a kilometre in 19.32s., or at the rate of 115.79 m.p.h. Walker continued down the shingle and passed the mile mark at 31.53s., which works out to 11.41 s. s. s. b.

out to 114.18 m.p.h.

This wonderful time was accomplished on April 14th, 1920, at Daytona Beach, Florida. Walker rode a 1,000 c.c. eightvalve twin, and his ride was supervised by A.A.A. officials. The officials are efficient men, and the electric timer has been certified for accuracy by the U.S. Naval Observatory. All rules regarding the running of record trials as laid down by the F.I.C.M. and the A.C.U. were complied with, and on confirmation by the former body the marks will stand as world's records.

Times with Standard Types.

A few more times made during the tests will possibly interest British riders. For instance, Walker, riding a 1,000 c.c. side by-side valve Indian, similar in design to the road motors of the Hendee design to the road micros of the refreder Co., receled off a kilometre in 21.64s., a mile in 34.65s., two miles in 69.71s., and five miles in 3m. 4.7s. This makes a world's record for this type of engine, for the mile was ridden at the rate of 103.95 m.p.h., and by a coincidence was .57 m.p.h. faster than the kilometre was rolled. Heretofore riders have a talked themselves black in the face praising the relative merits of inlet over exhaust and side-by-side valves. It, looks as though side-by-siders would have a good argu-ment from now on, especially when speed is mentioned.

Single-cylinder Speeds.

With a four-valve single-cylinder motor of 500 c.c. displacement Walker moved the world's records for this class up about ten notches. He whizzed past the kilometre mark in 25.08s. (88.19 m.p.h.), tank but the mile nect in 41.5s. (86.46). tore by the mile post in 41.55s. (86.64 m.p.h.); two miles were over in 1m. 23.03s., and five in 3m. 30.11s.

Harley-Davidson started this speed festival back in February of this year, when they sent a full crew of racing men and officials to Daytona to set up a lot of new marks. At that time, Leslie Parkhurst rode a kilometre in 21.56s., a mile in 34.89s., and the two and five miles in Im. 11.51s. and 2m. 59.89s. respectively. All this with a 1.000 c.c. eight-valve Harley-Davidson. Riding a pocket-valve machine of the same make, Parkhurst rolled the distances as follows: 21.75s., 36.34s., 1m. 15.47s., no five-mile mark made at that time. With a fourvalve single Harley-Davidson 79.48 m.p.h. was attained. All of these solo records were shattered, and it is only in the sidecar events that Harley-Davidson clings to their February attempts. These are as follow: kilometre 27.30s., mile 43.83s., two miles 1m. 25.69s., five miles 3m. 34.52s.

The Harley-Davidson Co. has just announced a new model sidecar. It has a swelling at the back of the body that will hold a lot of rainy day gear and spares that are needed on long trips. The body has streamline effect, with no sidecar door. A step attached to the body is the means of entering the sidecar. The Flexicar folks have used the same idea, with more attention to graceful lines.

The newcomer to American motor cycle ranks, the Ace, is now being road tested by its designer, W. G. Henderson. One passed through Newark last week on a long test that was successful, and the designer will go ahead with product fifty new motor cycles being the pland

output for the month of May.

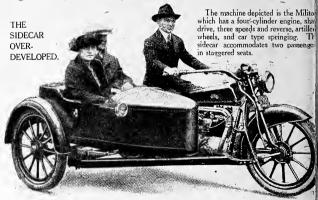

After much delay, the 1920 Exce of has reached the delivery stage. The water machine is a good-looking outfit, a sober Royal blue enamel, wonderly wide mudguards, and a sturdy front that it wide mugulards, and a strray front is that is an adaptation of the old Hende in fork. It is a caster type, with lerecoil spring mounted in front of is head of the motor cycle. The 27-xi fyres (which are oversize 26-x3in, to give plenty of wheel clearance.

Adopting 26in. Wheels.

26in, wheels are standard equipmen in the Excelsior, Henderson, Clevel: Ace, Indian Scout, and Sports Har only the large motors made by Har Davidson, Reading-Standard, and Insticking to the 28in. sizes. That 2 wheels will be popular with riders of large motors is evident; already m riders have equipped their machines the smaller wheels, although it cuts ad clearance down by an inch, making tr without a motor base protector.

Harley-Davidson are about to annor electrical equipment for their Sp model. It is understood that a gener of their own manufacture will be used

A successful four-cylinder Vee me cycle engine has been designed and tes out by its inventors in Hartford, Co. E. B. HOLTON

AMONG THE ACCESSORIES.

A Selection of New Accessories and Other Items of Interest to Motor Cyclists.

A five-minute vulcaniser, showing one of the "cartridges" in position

The St. Giles's collapsible work bench.

The Coy mudshield on a Douglas.

PROBABLY no other field attracts so many designers and makers of accessories as that of the motor cycle. Every week sees new ideas and new goods submitted for judgment and review, and we are able to deal with only a portion of them. This week's selection, among other things of interest, includes a useful little accessory known as the First Aid Mechanic, or F.A.M. It is a combination of nuts, bolts, and bars which can be used in a variety of ways for temporary repairs. The first day we carried it we found a use for it in holding together the broken ends of a mudguard stay. Its uses are too numerous to mention, and we recommend motor cyclists to send to the makers, B. Young and Co., Leek Street, Birmingham, for particulars. The price is 5s.

W. E. Coy, of 7, Gloncester Road, Kingston Hill, Surrey, has designed a mudshield, which brings the conventional type of motor cycle one step nearer the ideal on the point of cleanlines. The guard is cut from a single sheet of metal, which can be readily shaped to suit all the better known makes of machines. It extends from the head downwards, and then round to the footboards. A circular aperture in the centre allows air to reach the engine.

E. R. Wintle, the Midland competition rider, whose Stirling legshields were reviewed a short while back, is now marketing a bucket seat for the pillion. It is sprung on volute springs carried on sliding spindles, and small coil springs are also fitted to prevent undue movement when the seat is not occupied. It is made in two sizes (for adults and children respectively), is well upholstered, and is enamelled to match the machine. The price is 50s., and the makers are the Highgate Motor Co., 6, Highgate Road, Sparkbrook, Birmingham.

Another pillion seat which has a backrest is the latest model of the Ideal seat, made by the Coventry Ideal Pillion Co., St. Michael's Road, Stoke, Coventry. The illustration is self-explanatory, it only being necessary to point out that the back rest is secured to the sprung part of the attachment.

Amateur mechanics will be interested in the several tool stands and work benches now on the market. Two are illustrated, of which the St. Giles is of wood and is collapsible, folding into a compact form for storage. The bench illustrated has no fewer than thirty tools, including grinder and vice. The dimensions are 3ft. 6in.x1ft. 9in.x2ft. 8in. high, and the price is £17 17s., complete with four tubular steel legs and undershelf. The makers are St. Giles Engineering Works, Northampton. The other bench illustrated is of metal and is on small wheels, the idea being that the bench may be taken to the job instead of conveying heavy parts to the bench, a point which will make an appeal to garages and workshops. The size is 24in.x24in.x30in. high, weight 2 cwt. 2 qrs. 14 lb., and the price £5 12s. 6d. It is made by the Progressive Engineering Co., Ltd., of Leiccester, Deuton, and 40, Brazennose Street, Manchester.

The Coventry Ideal pillion seat, with back rest, which sells at 50s.

The Canoelet spring L, and K. 10/6 automatic blow lamp

The Stirling pillion seat.

L. and K. paste solder is made up in small tubes.

The F.A.M. (First Aid Mechanic), a useful accessory to execute temporary

repairs.

The Cearus tube carrier

C.L. pillion seat, which has adjustable springing.

The C. P. Preston Co., of 112, High Holborn, W.C.1, introduces a gauzeless filter, which has been demonstrated to us, proving that it effectively traps water and foreign matter in the petrol supply system.

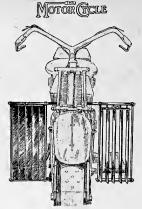

Still another pillion attachment is the C.L., a speciality of C. Lamb, 32, Edmund Road, Saltley, Birmingham. It has adjustable springing, and it is claimed that side sway is eliminated. The price is 45s.

A "five-minute" vulcaniser, of a size suitable for the toolbag, is the Shaler, an American product with which J. R. Cran of Dingwall is specialising. The 12s. 6d. outfit includes vulcaniser, six round and six oblong patches, each of which consists of a metal cartridge which is clamped over the puncture, lighted, and, it is said, in five minutes the cartridge may be removed, leaving the patch properly vulcanised to the tube.

properly vuicanised to the dube. The T.H.M. Manufacturing Co., Ltd., of 2-13, Rosemont Road, Hampstead, N.W.3, submit a pair of neat footrests with rubber pads, which they are marketing at 8s. 9d. per pair retail. The body is of aluminium die cast with a thick rubber pad of good quality.

L. and K. soldering paste is something many motor cyclists would carry in their toolbags if, they knew its properties. It is sold in small tubes at 2s. 6d., and can be used for soldering such things as wire ends and leaking tanks. Incidentally, as an experiment, we firmly joined together two drawing pins with the aid of a match. It is made by Livermore and Knight, Ltd., 180, Fleet Street, E.C.4, who also market an automatic blow lamp for 10s. 6d. Its size is $6\times 2\times 14$ in. Both these specialities should become popular with competitors in long-distance trials.

Those sidecar passengers who had let the need for a spring footrest in he nose of the sidecar will be interested in the device now offered as an extr by Messrs. Mead and Deakin, the man acturers of Canoelet sidecars. It could be a light board, with heel piece, vet is supported by two flat steel spring the sidecars.

G. J. Moulder, 23, Arlington I a Regent's Park, N.W.1, will shortly in duce a twist grip control which wi be made in various sizes to suit Bis machines. The construction is sirk and can be fitted easily to any stan handle-bar. A circular box is ple over the open end of the handle-bar is held in any convenient position split collar. The illustration rendelong description unnecessary.

An aluminium spare tube case for handle-bar is introduced by P. L. Ce, as Plaistow Park Road, Plaistow, 13 Both the container and the lid are uninium spinnings, which are clarst together by a central bolt with butth nut. It is attached to the handle-bar a clip, and an orifice allows the valve protrude. A rubber sleeve over in spindle is inserted to prevent chaft

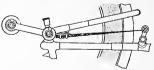

A NEAT SPRING FRAME DESIGN.

The Patent of a D.R. which embodies Leaf or Coil Springs.

ALL spring frames are not conspicuous for their neatness; in fact, quite a large number of preliminary designs are the reverse. The design inustrated, however, presents a good appearance, and embodies sound mechanical principles.

It will be seen that the wheel is carried at the end of two extensions of a tubular loop, which passes round the front of the wheel below the rigid "chain" stay. At the pivotal ends of this loop there are substantial cup and cone hearings which are adjustable, and just forward of the bearings saddles are provided for

the butt ends of two flat quarter-elliptic springs, which are shackled at their outer ends.

Rear wheel springing of the Willoughby

This design permits a neat construction, which may be applied also to be sidecar wheel.

Another form of the invention embels coil springs and a rubber "snub!" between the stays and the inner en of the loop.

The designs are the subject of patits taken out by Mr. N. D. Willoughbyof 12, Mosley Street, Manchester, on incidentally, is a disabled D.R.

We understand that he is prepared negotiate with any manufacturers he may be interested.

The Editor does not hold himself responsible for the opinions of his correspondents,

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A MAGNETO TIP.

Sir,-If any of your readers are suddenly aggravated with stuck-up magneto -rocker-arm, and are in too much of hurry to free it permanently, this wrinkle may help, a mary to tree to permanently, this within a may be though I don't for a moment suppose it is original. Place a small piece of rubber behind the rocker-arm. This will force the points together when they should close, at the same time being resilient enough to allow them to open.
- Quetta, Baluchistan. - C.H.C.

FOUR-CYLINDER ENGINES.

Sir,—It is with feelings of astonishment that I read Ixion's" remarks in March 18th issue of The Motor Cycle regarding the cost and complication of the four-cylinder

In my opinion the four-cylinder engine is far more simple for even the novice to understand and keep in tune than any V twin (or flat twin for that matter), is quite as cheap to make, and cannot be equalled for economy in running. Can "Ixion" name any V or flat twin of over 3½ h.p., or Can "Ixion" name any v or nat twin of over o_2 in.p., on any single of over 4 h.p., which will give 70 m.p.g. hauling a heavy sidecar? I can personally show him at least two four-cylinder engines which have done this repeatedly, and each is over 1,000 c.c. W. ARTHUR LONG.

GOOD SERVICE.

Sir,-In these times of high prices and delay in repair work, it is a pleasure to bring before the readers of The Motor Cycle the courteous and generous treatment received by me from Messrs, Smith and Sons (M.A.), Ltd.

My speedometer required overhauling and replacements, so I forwarded it to the makers, asking them please to

overhaul and replace parts.

For this repair I expected a somewhat formidable bill, but imagine my pleasant surprise when, within a fortnight, my speedometer was returned to me, overhauled and fitted with a new cable outer casing and gear box, and a note stating the repairs were free of charge.

T. C. BAUMFIELD.

RACING.

Sir,-Now that the old motor competitions are coming into their own again, and the T.T. is being revived, the question The both again, and the 11.1s being revived, the question crops up on all sides, "Does racing help the motor trade?"

And the answer comes back every time, "No!"

Racing appeals to the sensation-loving public, but it goes

no further. The fact that a certain motor bicycle covered so many laps in so many seconds does not say the stock model of the same make will be best for ordinary road wear. The only outsiders who seem to be interested in these races are the black-as-ink maniacs who simply ride motor bicycles to bits, and the filberts who "tap pater for a two-stroke" and the about with racing helmets on. The real buyers—the business men—look on race results with little or no interest. Reliability, not spurts, please.

SYDNEY DU ROSE. Reliability, not spurts, please.

PETROL ECONOMY.

Sir,-In a recent issue of The Motor Cycle I read a letter signed by Mr. T. E. Smith re petrol economy, but I fail

to see where the economy comes in.

Perhaps the following will interest some motor cyclists and motor car owners, as regards economy, but not efficiency.

My machine is a 6 to 8 h.p. Precision engined (fitted with special atomising valves) motor cycle and large sized wicker

sidecar; total weight of combination about 300 lb., weight of myself and two passengers (wife and boy) about 27 stone, and my last year's mileage works out at 80 m.p.g. for

all distances, long and short.

One special test I made was of 126 miles, partly in drizzling rain, and the consumption was one and a half gallon of benzole, which I consider fair, still not efficient.

During the winter I overhauled my machine and fitted a hot air arrangement, and from a trial run which I had in bad weather I am expecting better results than the above. I may mention that the machine is fitted with a Stewart speedometer, also a very old Amac carburetter. Liverpool.

FOOT-OPERATED GEAR CHANGE.

Sir,—As a reader of your valuable columns, I should like to raise the question of foot controlled gear change appliances. The only examples I know of on the market at present are the Sturmey-Archer gear boxes up to the 1919 model. The gear change lever on these can be adjusted to be worked by either hand or foot. Unfortunately the

It is a worken by either hand or toot. Unfortunately the latest type of the make is designed to work by hand only. I can safely say that 90% of the D.R.'s who rode Triumphs during the war used the foot for changing gear. The result is always a much quieter change, and consequently less shock to both engine and transmission. For a complex when changing and transmission. example, when changing up, the clutch can be disengaged with one hand, the throttle slightly closed with the other, and at the same time the gear change lever can be moved

Another point- in favour is that the hands can be kept on the bars the whole time, which is a considerable advan-tage when riding solo, or with pillion passenger, over

greasy" roads.
What do other readers think about this? SIGNALS.

STARTING TIPS:

Sir,—May I refer briefly to your correspondent "C.B.M-B.'s" remarks, in your issue for May 6th, on starting a B.S.A.?

He recommends that the engine should invariably be primed, and that the B.S.A. carburetter, with its variable jet should be replaced by one not so fitted. I have ridden a B.S.A. all the year round, and find that priming is totally unnecessary if the variable jet in question be opened a couple of turns. This provides a rich mixture on which the

engine fires almost at once.

For other reasons, "scrapping" this carburetter is to deprive the machine of one of its most valuable features. The jet can be adjusted to meet the exigencies of the road with the same ease, as, for instance, retarding the spark, This means a big reserve of power for the occasional stiff hill; and, on the other hand, the maximum possible economy for ordinary running. I have repeatedly worked out my average petrol consumption over long periods, including both good perfor consumption over rong periods, including both good and bad roads, short runs as well as long, in both town and country, and it is invariably 100 m.p.g. For a machine of this power and weight that is a more than creditable record.

I venture to hope that readers of The Motor Cycle will not accept your correspondent's extraordinary statement that the B.S.A. adjustable jet is a "source of much anxiety" without further explanation from him.

The usual disclaimer.

L. P. GARROD.

RUNNING COSTS.

Sir,-I was interested in the article, "Running Costs," in The Motor Cycle of April 15th, because I have most carefully during the last year kept a strictly accurate account of my expenses in running a 7-9 h.p. Harley-Davidson combination.

Now I should class myself under "W.W.S.'s" second temperamental class of rider, doing everything I can myself and driving carefully and steadily, with no fancy notions for adding on gadgets, but a liking for powerful machines with a good turn of speed that I can use if wanted, and enable me to do my two hundred miles run in the day without undue exertion any time required, and I ride solely for pleasure.

I think when one knows the type of rider it is always much easier to form a proper valuation of his running costs in comparison with one's own requirements.

I have not gone carefully into the comparison of various specified figures given by "W.W.S." with my own, but I see his C C line on the expenditure mileage chart for 6,000 miles would very nearly bear out my own figures, which I enclose you herewith, as they may prove interesting. There is, you will notice, an item of repairs which rather upsets the figures.

This, I may explain, was brought about by an accident to my sidecar while in the garage. Some fellow ran his Ford into it, which cost me £17 to repair. His insurance company (which is also the same as my own) quibbles over the amount, and offers £7 only, and it looks as though there is nothing for it but to regard the £10 as lost, and treat it as I have done in my figures. JAMES C. BATKIN.

MOTOR (YCLE

SPEEDS.

Sir,-Your correspondent, "C.L.W.," in your issue May 6th, would doubtless like to see the ancient imputatio "all men are liars" altered to "the vast majority of motor cyclists are liars. He_"would like to know how speed of nearly 70 m.p.h. is done on the road."

It is done by opening the throttle of a high-powered, well trued maybine as a cyclibly attaight and more the stretch of th

tuned machine on a suitably straight and smooth stretch (road, and sitting a little tighter than usual.

I have a fully equipped Indian of last year's date, an would be delighted to demonstrate that it will do 65 m.p.l would be delighted to demonstrate that it will do 50 m.p.l. if he would care to call at some convenient time wheneve he happens to be in my part of the world. I will not tr and sell it to him! I have never experienced wobble of Indians, due probably to the excellent balance and weigh distribution obtainable when T.T. bars are fitted to the machines.

Welwyn, Herts.

Sir,-I have twice experienced an unpleasant wobble whe riding a motor cycle solo, and on a similar type of machine I traced the trouble in each case to one of the tyres, which although fitted correctly to a perfectly true rim, was runnin out of truth, owing to it having been badly moulded. Bot tyres were of the three-ribbed type which has a flat tread but of different well-known makes.

I experienced a wobble at two different speeds, which varied slightly with the condition of the road, but in m case took place at approximately 25 m.p.h. and 45 m.p.h.

L. E. R. MURRAY.

Sir,—I have never written to your paper hefore, although I take it in regularly, but the letter from "Limit," in you issue of April 22nd, and the one from "C.L.W." (May 6th) are really more than I can stand.

Your correspondent's idea that to obtain a speed of 67 to 70 m.p.h. one must go on to Brooklands is merely amusing myself have done 65 m.p.h. on a 1919 4 h.p. Triumph sol and 66.5 m.p.h. on a 79 h.p. Harley-Davidson with my and 66.5 m.p.h. on a 7-9 h.p. Harley-Davidson with my brother on the carrier. These speeds were attained withou any tuning whatever and under quite normal conditions, and they certainly do not strike me as being anything very wonderful. The road in each case was clear of traffic and dead straight (or almost) for about two miles. There can be no doubt about the accuracy of these speeds, as the were recorded by two separate speedometers. These speed bursts, naturally, cannot often be indulged in; but, given good road, and a decent engine, I quite fail to see any diffi culty in attaining them.

Cockermouth.

DUST IN SIDECARS.

Sir,-1s there any means of overcoming dust in sidecars

where a windscreen is used?

In my case, behind the screen the air is full of dust, quite visible to the eye, the result being that the passenger is covered in a very few miles.

I use a glass screen with side wings, and should be gradeful for any hint from your readers for overcoming this nuisance.

A. JOHNSTONE.

ACETYLENE LIGHTING.

ACETYLENE LIGHTING.

Sir,—Having, like many others, taken an oath never to "wait for the smell" again, I am very interested in other forms of lighting. "Lxion," I notice, leaves out accumulators in his alternatives to the usual acetylene. My agent, who is getting me a 1920 machine, deprecates the very idea of this form of lighting. As opposed to this, one amateur competition rider has made a very great success of it, and, given a spring frame, I certainly think there is little to be said against it, provided attention is given to the cells by an intelligent owner. I notice also that a few firms are advertising accumulator sets nowadays, and there are at least two reliable non-spillable types of cells on the market. One of your correspondents led off with a rather curious test question a few weeks back, and I have a rather enrious test question a few weeks back, and I have another, though a bit easier of solution. In an 8 h.p. JAP. Itted with DINE magneto and Amac carbinetter, mistring occurred under heavy load and at high speed only. Plugs, valves, magneto, and everything appeared to be functioning properly, and did at moderate speeds, and always on the stand. No difficulty in starting. The valves terms were perfectly straight.

W.D.B. Seaton Carew.

DIFFICULT STARTING.

Sir,-I'am interested in "J.M.M.'s" letter in the issue of April 22nd com-plaining of the difficulty of starting a B.S.A. motor cycle, since I experienced a certain trouble myself when I first obtained my own.

I can now start it quite easily, usually on the first dig. I keep the tappets set with a very small clearance. viz., four-thousandths of an inch. This gradually increases with use to about eight or ten-thousandths, when I again

set them. I inject enough petrol through the compression cock to free the piston, so that the engine revolves easily with

exhaust lever lifted. I then give one good "dig." which usually starts the engine. Much depends on correct setting of the controls. Throttle lever directly above handlebar. This means about one-third

Air lever a little more than this, Ignition lever about one-third retarded. I find with the B.S.A. carburetter that it is quite impossible to start if, for any accidental reason, it has fleeded. This sometimes takes place if the needle valve has stuck (in-

verted needle, i.e., inlet at the top of float chamber, in my carburetter).

If this takes place the only remedy is to close the petrol tap and revolve the engine until the surplus petrol has been quite evaporated. V. H. SUGDEN.

Sir,-In reply to "J.M.M.," my experience with a new B.S.A. 44 h.p., gear box. Altoget which I started riding last December, may be helpful. I run the variable jet for sidecar work at the full turn. Set the gas nearly out to the handle-bar, and give half as much air. Stand by the side of the machine and swing the handle-bars over to be able to kick well under while operating the exhaust. Feel compression, raise the exhaust, and push rather than kick with a long stroke, dropping the valve towards the end.

My engine fires nearly always at the second kick, generally without priming. If I prime, I give more air. I think the common fault is using too rich a mixture. It is a more of the prime of the second of the secon Lee, S.E.12.

MOTOR CYCLE LEGISLATION.

Sir,-Your leading article concerning the position of motor yelists with regard to the Departmental Committee on Taxation and the Departmental Committee on Lights on Vehicles

tion and the Departmental Committee on Liquis on Sciences is somewhat inaccurate in one particular.

Motor cyclists were certainly represented on the Taxation Committee by the A.A., and as the representative of the A.A. on this Committee, I represented, as pointed out in my Minority Report, private motorists; and, as you know, the membership of the A.A. includes many thousands of motor cyclists.

Similarly, in regard to the Departmental Committee on Lights on Vehicles, the Association was represented by Lights on Venices, the Association was represented by Lt.-Col. Charles Jarrott, a pioneer motor cyclists, and one who is keenly interested in all matters affecting the interests of present-day motor cyclists.

STENSON COOKE,

Secretary the Automobile Association and Motor Union.

[We fully appreciate that Major Stenson Cooke as secretary of the A.A. and M.U. represented a good number of motor cyclists, but he also represents perhaps a larger number of private car owners whose interests sometimes are not co-incident with those of motor cyclists. The Minority Report referred to did not contain any reference to motor cycles except in the following phrase: "The transfer of licences from one owner to another where a car or motor cycle changes hands." No recommendations to help motor cyclists were included .- ED.]

A SKILLED ENGINEER'S HANDIWORK.

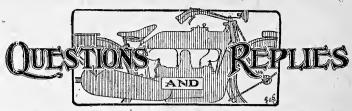

This motor cycle, including the engine, was made entirely by Mr. E. Chandler, of the Dukeries Motor Co., Mansfield, in 1917. The specification includes a 7-9 h.p. twin engine, 83 × 97 mm., with side-by-side valves, Binks carburetter, U.H. magneto, and a four-speed gear box. Altogether the machine appears to be a well made and very sporting mount

WARNING TO MOTOR CYCLISTS.

Sir,-Will you allow me a few lines of your valuable paper to warn riders of the danger of having their mechanical horns fixed on the tanks so near to the generators of the front lamps, that when they work loose, through the jolting of the machine, they can jam against the horn, and so interfere with the steering?

Recently I saw an accident caused in this way.

EUSTACE B. PARSONS.

A selection of questions of general interest received from readers and our reputs thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not mast be accompanied by a stampad addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

"Benzoil" Lubrication.

The manufacturers of my carburetter state in a booklet that benzole will not mix with oil, and cannot therefore be used in a two-stroke engine to make petroli. Enquiries have been made, and a mixture of 60% benzole and 40% petrol is suggested as satisfactory. I have a two-stroke machine, in which petrol is used, and as I desire to use benzole, but certainly do not wish to damage the machine with improper lubrication, shall be glad if you can give me some light on the subject.—

We do not know what grounds the makers of the carburetter have for stating that benzole will not mix with oil. We ourselves have used a two-stroke machine for the last six months, running entirely on benzole which has been mixed with oil, and have noticed no ill-effects.

Right to Build a Shed.

Could you please answer the following? I am expecting to take possession of a motor cycle at any time. As there is a small yard at the back of the house, the landlady was approached to see if it would be right if I erected a sectional hut. This was done really as a matter of courtesy, as I never expected any trouble. Her answer was that I had better not erect one. There is no agreement in the letting with reference to erections, and no inconvenience would be caused to anyone else. Can the owner of property prevent legally a tenant from erecting a sectional hut? Are there any other restrictions on such erections?—H. E. E.

As there is no agreement between the landlord and tenant to prevent the erection of a sectional hut, there is nothing to hinder you so doing, provided you do no damage to the landlord's property in any way, and you should take care that the hut is erected in such a way that it remains a tenant's fixture, and does not become part of the property. The above remarks are subject to the following points, which you must carefully watch : You must take care to comply with any local byelaws, and not intringe any building covenants or restrictions which may relate to the house in which you It is quite possible when the estate was laid out restrictions were imposed, and if your landlady is subject to these, you would also be bound by the same restrictions.

Lack of Tune.

Can you please give me some advice on the following problem? I have a 1915 2\(\frac{3}{2} \) h.p. Douglas, which I am about to overhaul, as I can only average 30 m.p.g. on No 1 sprit. I have used a 28 jet in the Amac carburetter, and am now using a 25; the petrol level has been altered several times with no better results. The machine will go splendidly for a mile or so, and then begin to bang in the silencer and carburetter. I am using aero plugs.—G.H.T.

It is very difficult to say exactly what is the cause of the trouble. Presumably, the engine is not in a very good condition, and we would advise that you attend to the following points. Decarbonise cylinders and examine condition of the piston rings, replacing these if hadly worn; also replace pistons if these are very slack in the cylinders. Examine the inlet valve stems, and replace the valves if they are very loose in their guides. Replace all the valve springs if they have lost their tension. Replace the aero plugs with

good motor cycle plugs; you will in them much more satisfactory. When assembling, carefully examine the inction pipe joints, and if air leaks suspected, wrap the outside of the unis with insulation tape.

Timing a Single.

Would you please be g enough to let me know correct valve timing for a single-cylinder engine?—T.L.

Rotate the engine until the piston is the top dead centre, and insert the cr so that the exhaust valve is just ab to close and the inlet just commencing open. Now rotate the engine throone complete revolution, when the pis will be at the top of the compress stroke. Rotate the magneto until contact breaker points are just comencing to separate (the control le being two-thirds retarded); connect magneto drive without allowing eit engine or magneto to move from the points. The above timing will prove best for ordinary running.

Attractive scenery is lound on the outskirts of many Yorkshire manulacturing towns. One would little imagine that the motor cyclist depicted, driving an 8 h.p. Enfield outfit in the recent Sheffield Traders Trial is but a little way outside the amous steel-making city

MOTOR (YCLE

Removing Timing Pinion.

I am now engaged in overhauling my 1911 (or 1912) 34 h.p. Triumph motor cycle, and your valuable advice will be very helpvaluable advice will be very help ful on the following points: (1.) I find I want new bushes for the connecting rod. I have taken the engine down, and the crank case comes into two parts, but I cannot get one half away owing to the central wheel of the timing gear. This wheel appears to be keyed on, and has in the centre what appears to be a large screw, which has detied all my efforts to undo. Can you advise me how to get it eff, as until I do so it is impossible to get at the connecting rod? (2.) Will you give me the settings for timing the valves; also for the ignition?—G.H.M.

.) The small timing wheel on the engine aft is held by the end of the shaft itself sing expanded into it by a conical headed These screws are usually very ght and difficult to remove. You will quire a brace and screwdriver bit, or ou might use a large screwdriver, atting extra leverage on with a spanner.

The timing is as follows: Exhaust dive closes when the piston reaches topond centre of exhaust stroke and the let valve at this point is just commencing to open. The spark should occur hen the piston reaches the top dead entre, the control being two-thirds

A Case of Over-driving.

(1.) I have a 23 h.p. Royal Enfield twin motor cycle, and have recently had the rear cylinder recently had the rear cylin-fitted. The machine starts off well and I have plenty of reserve power on the level, but after main-taining a speed of 30 to 25 m.p.h. for a few minutes the engine appears to seize, but upon dismounting I can easily revolve the engine by turning the back wheel. What is the cause of this? (2.) I have not sufficient power on hills, and the engine appears to drag. Would this be due to the expansion of the piston or rings through heat? (3.) There is only one very narrow groove turned in the piston for oil-retaining purposes. Would it not be advisable to have several grooves or holes bored on the side of the piston? I may say I have given the engine very liberal oiling, and have done about 150 miles since the new piston was fitted .- A.A.H.

1.) The sudden stopping may be due o a momentary seizure, but it may also esult from the use of an unsuitable parking plug, the electrodes of which accome overheated, so causing pre-igni-ion. (2.) No doubt the power will improve after the engine has been run or about 500 miles. After this distance, on may assume that the parts are all properly run in. (3.) It is not at all certain that additional grooves or holes n the piston would improve the running. We should say that such trouble as you have experienced is due to travelling te excessive speeds immediately after the ylinder was rebored. You should cerainly not have attempted either to ttain or maintain a speed of 30 to 35 n.p.h. until the new parts were horoughly bedded down.

IMPORTANT DATES.

Lightweight Sidecar Outfits.

(1.) I have a 23 h.p. lightweight (four-stroke), to which I have attached a small wicker sidecar. Now, the opinions of my friends are very uncertain as to the success of this outfit, and I should success of this outil, and I should like your views as to whether this will damage the engine? (2.) Whether my frame is very liable to fracture? (3.) Is it possible in any way to help the engine with its load? Things in its favour are: I only use the sidecar once or twice a week to do a distance of about ten miles, and that the engine is powerful enough to do all the work I require of it. The only thing I fear require of it. The is the frame.—R.P.

During a recent week end, whilst out on a two hours' run, no fewer than five sidecars were encountered by a member of the staff very much out of alignment. The outfit shown is a typical example. Besides being risky, it throws extra strain on the tyres.

(1.) Provided you maintain adequate Jubrication, the engine will not suffer from the extra work imposed upon it (2.) It is not likely that the frame will break; but you must remember that a machine of this description was not designed to withstand the strain of sidecar signed to winistand the strain of successive work, and, consequently, you should drive carefully and at moderate speeds, particularly on bad road surfaces. (3.) Only by driving with extreme care and by avoiding overloading and attempts at excessive speeds.

Charging Accumulators.

I have a 4 volt 20 ampère accumulator which I am using for lighting head light. Will you be good enough to let me know how to charge this from a light-ing circuit of 225 volts continuous current? The charging rate, as stated in the accumulator, is 1 ampère, and lamps in use are 40 c.p. metal filament. How many of these should ! havé to use as a resistance, or would it be better to use a 16 c.p. carbon filament lamp as resistance?—T. 4749.

Carbon filament lamps are the most suitaccumulators you would require two 32 c.p. bulbs of this type in series for charging your accumulator. If you decide to use metal filament lamps you will require five of 40 c.p.

RECOMMENDED ROUTES.

LEICESTER TO YARMOUTH .- G. H.K.

Leicester, Uppingham, Wansford, Peterborough, Wisbech, King's Lynn, Swaffham, Dereham, Norwich, Acle, Yar-

THE FUEL OUTLOOK.

Will Power Alcohol become a Commercial Product before the Wells Run Dry?

A CCORDING to the best available information, it may be taken for granted that American and Mexican oilfields will have no surplus fuel for export in a few years' time, because:

(1.) The supply of petroleum oils is diminishing.
(2.) The vast increase of motor transport in America will absorb the whole of the oilfields' output.

It is even suggested on good authority that in a few

years' time America will be importing oil.

In explanation of this, it may be said that in April, 1919, the output of thirty-two American car factories reached a total of 7,084 vehicles daily. Assuming 300 working days per year, at this rate the yearly output will be 2,125,200 vehicles, and if each car is estimated to consume 200 gallons annually, the increase of American motor transport alone will account

for over 400 million gallons of fuel.

At the present time the Government have no control over the price of petrol sold in this country, though it is hoped that something may be done in this respect, but the most optimistic mind cannot foresee a reduction in the cost of petrol, which will be sold to the highest bidder, and a limitation of price would merely close the supply. In South America, petrol is now being sold at 8s. per gallon. authority is of the opinion that we, in this country, may have to pay this price in one or two years' time. There is little doubt about this point if the demand. increases and no alternative fuels are brought forward. Scores of new companies have been formed to produce motor vehicles without the slightest regard for an increased fuel supply. The question, then, of alternative fuels to petrol, instead of being automatically solved with the end of the war, needs immediate and influential consideration. To allow the vast and vital motor industry to be practically dependent on one imported fuel is little short of insane folly. Briefly, the position is that petrol will shortly he unobtainable to meet our demand or obtainable only by paying a higher price than other countries.

Home-produced Fuels.

What, then, are the possible alternative fuels? Home-produced petroleum cannot be relied on, and the position as regards home-produced benzole is, to say the least, uncertain. Out of seventeen million tons of coal carbonised at gasworks in 1918, only 6.300,000 tons were treated for benzole recovery. There is no doubt that gas works are now producing even less benzole than in 1918. The petrol companies are obtaining supplies of benzole which they market themselves, thus minimising the efforts of the National Benzole Association to market a standard product at a reasonable price. This association has failed to control both benzole production and distribution, and if it continues to fail, so will the petrol companies obtain a firmer hold on the sole serious competitor of petrol.

Alcohol is not produced in this country in any serious quantity for use as a motor propellant, but many are of the belief that the ultimate success of the motor industry rests on a large alcohol production. The belief has a foundation on the fact that the present sources of petrol and benzole are of a mineral nature and consequently limited, whereas alcohol can be produced from such vegetation as the Nipa palm found in India and Africa, the Agave in South America, and many other plants. A limitless source is therefore assured. Also alcohol production from black strap molasses is a growing industry in America, and still another source of alcohol is coal gas.

Alcohol from Coal Gas.

In a paper read before the Cleveland Institute of Engineers at Middlesbrough on December 15th, 1919, an account was given of the joint research work of Messrs. Ernest Bury and O. Ollander, dealing with the extraction of ethylene from coal gas and its subsequent conversion to absolute alcohol.

This epoch-making work is of the greatest importance to motorists and the British public generally, as the authors of the work claim that it is commercially possible to recover r.6 gallons of absolute alcohol from one ton of coal when carbonised in the gasworks and coke oven industry. It needs no penetrating vision to estimate the importance of a possibly large addition to our supply of home-produced fuels. The figures given of our position as regards home-produced fuels if ethylene was recovered from all coal carbonised in this country are as follow:

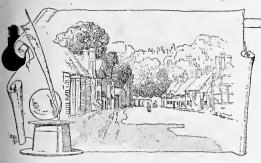

Total, 114.4 million gallons against requirements of 160 millions.

Most motorists are aware that coal gas is the source of our benzole supply. After benzole has been extracted from coal gas, the gas still contains approximately 2% of ethylene which can be extracted and subsequently converted into alcohol. It is claimed that this can be done on a commercial scale, and the research work which has been carried out is of profound importance.

Producer Gas.

A fuel little heard of by motorists is producer gas. Experiments have been carried out dealing with the use of a portable gas producer plant for gas generation on motor vehicles. A great amount of power is derived from internal combustion engines using producer gas generated by stationary gas producer plants so that the only difficulty presenting itself is the design of a producer gas plant capable of installation on a motor vehicle. When used in the same engine, Mr. D. J. Smith, the author of the experiments, asserts that, with coal at 49s. per ton, producer gas is equal to petrol at 2½d. per gallon. For commercial vehicles, the idea certainly seems practicable, but, for lighter vehicles, the value of the proposition is ministed by the weight and space taken up.

L.S.

"If this big tax is put on, I, for one, shall give it all up, as a good many others may do also. Why do not all motorists who can spare their machines lay them aside and boycott the whole business

P. S. SQUIRRELL.

"The motor cycle is the poor man's friend, and it looks as if he must give it up. The miner and factory hand, from factory. . The Government wants the working man to do his utmost. How can he when his little pleasure is taken from him?" Monday until Saturday, are down the mine or in a noisy

Bridgend.

"My wife is affected with a malady which renders any serious walking impossible, and her only chance of fresh air and pleasure is a short run out of about forty miles from the suburbs of London. . . My total mileage in 1919 was only 839 miles. It seldom exceeded this, even in pre-war days. There must be many whose mileage is limited by reason of the fact that the machine is not used during the winter months and inclement weather. To saddle such with the total duty of £4 is unjust."

THOMAS A. VALE.

"This new scheme of extortion must not be permitted to become law, for it only hits hardest those who are least able to bear the added burden. Let us all—motorists, motor cyclists, scooterists, and Auto-wheelists—with unbroken front show in unmistakable manner that we are not to be from snow in unmistanable manner that we are not to brow-beaten or bullied into extortion of a type several degrees worse than highway robbery. All luck to the A.A. for their sporting efforts on behalf of motorists—efforts which cannot but be successful if properly supported by the body of motorists in this country.

Birmingham.

Unit UNION IS STRENGTH.

"Passive Resistance" Suggested.

"I think the blind credulity with which people lie low and trust to the Government to dole them out 'British fairness' is almost pathetic. . . . They are out for tarrness' is almost pathetic. . . They are out for taxes, and they exact them unfairly from any section of the community which is not strong enough to stand up for its rights. A resolution to refuse to pay any taxes until they are placed on a fair basis, and signed by as many people as signed the petrol petitions, is needed to bring the Government to its senses."

DUGGIE. Cambridge. Cambridge.

"Is it not time the R.A.C., A.A. and M.U., and the A.C.U. centralised instead of working independently? We may as well not join a union if there are so many working separately instead of joining together to protect and fight for the motorists' interests. I should like to see one of the many motor unions shine above the others and really do something, instead of writing letters to the Press-we can do that."

Manchester.

"The composition of the committee is, in itself, sufficient to show the motoring public that they are expected to pay the whole of the bill for repairs to the roads, which were destroyed by the Government themselves with their 'war traffic.' Granted, the traffic was necessary, but why 652,000

STORM OF PROTEST.

Letters Typical of Thousands we have Received.

The General Trend of our Readers' Views is that the Average Rider will find his Hobby a Financial Impossibility.

motorists should be called upon to pay for something in which every other person in the land holds an almost equal share every other person in the land bôlds an almost equal share passes my comprehension. Even the proposed scheme of the A.C.U, is unfair. Why should a 3½ h.p. single a few pounds over 200 lb. pay the same as a mile-eating 10 h.p. twin? If they are going to grade the machines by weight, the fairest way would be to start at £1 for 100 lb. minimum and 8s. extra for every 50 lb. This would be fair to all, and then the £1 for the sidecar could stand by itself. All motorists should, on December 31st, 1920, go on strike until the committee get some sense into it. I shall gracefully retire after this year."

Another Tortoise. Manchester.

Hardship to those of Moderate Means.

"Though I am a pedal cyclist, I fail to see why motorists should pay all the tax and cyclists none. Why not impose a tax of, say, 2s. or 2s. 6d. on each pedal cycle? This would help a little to make the tax on motors a little less heavy.

"I beg to suggest that our associations take combined action to press the Chancellor for the following compromise, action to press the Chancellor for the following compromise, which I feel will meet almost the whole objection that motor cyclists have to the proposed changes in the basis of taxation: That licences be issued half-yearly, viz., April 1-1 to September 30th and October 1st to March 31st in payment of half the amounts proposed. If this be allowed, as surely it ought as only an act of elementary justice, we shall then be taxed for the proportion of the year that the great majority of us use the roads. The small minority that are compelled, or desire, to use the roads from October 1st to March would then pay the second instalment."

W. Stiles.

"The majority of working men have to be satisfied with a second-hand mount, and if a sidecar is attached they are asked to paya £4 tax. If one takes the journeys that a worker does throughout the year, it will be found that the mileage does involgnout the year, it was be found that the influence is very low, and during the winter months the machine is generally lying idle. The longest ride I have had was 110 miles, and I do not think many working men exceed this distance. If this £4 tax-becomes law, I, for one, shall have to give it up."

R. H. STACEY.

"I may say that I, as doubtless were thousands of others, was greatly surprised to find that, despite all the views expressed to the contrary in your columns, the committee formed to consider the question still persisted in their unfair tax of £4 for a sidecar machine, and, not content with this, absolutely denied to riders the benefit of the quarterly payment scheme which was granted to car owners. We all realise that extra tax is necessary, and perhaps heavy taxes, and if done on a fair basis motor cyclists will be the last to complain; but as at present worked out, no—the game is not worth the candle!" P. SMITH.

"My wife and I ride a Velocette two-stroke each, thus paying £2 a year tax plus the expense of fuel for two. If paying £2 a year tax plus the expense of their for two. we have one heavyweight between us, we are worse off than ever; the new tax being £4, whereas the two lightweights would only cost £3. If we are to save our sport from being wiped out, let us join as a body and fight this injustice to a finish."

Gimes to Light Lamps

Invalid Motor Tricycles.

The taxation proposals include a 5s. tax on "vehicles not exceeding 5 cwt. unladen, adapted and used for invalids."

Holiday Traffic.

During holiday seasons there is always more traffic on the roads, and it behoves motorists to exercise especial care.

Touring in Wales.

A Welsh reader warns intending tourists in the Principality concerning the road between Lake Vyrnwy and Bala. The surface is said to be practically washed out in places, while on the Vyrnwy side a fallen tree partially blocks the road.

Power Alcohol.

• The new Finance Bill embodying the recommendations of the Departmental Committee in regard to the proposed new taxes provides for legalising the production of power alcohol free from the spirits duty which has prohibited its manufacture as a fuel.

Beware of Stolen Machines.

Thieves are still busy. Advices reach us of three stolen machines as follows: Glasgow: 1919 A.J.S., frame, engine,

and gear numbered 11108, sidecar 2283. Liverpool: 1919 Sunbeam, frame 6701,

engine 6116, and gear box 9640.
London (Tottenham Court Road):
Triumph; top tube enamel chipped.

Tool Kit Found.

Mr. S. Harrison, 41, The Grove, Hammersmith, recently picked up a Triumph tool kit and will return it to the owner on correct description of the contents.

Open Events in Ireland.

Although as a rule English riders do not journey across the Irish Sea to compete in the Irish events, those with time for a holiday would no doubt have a hearty welcome from their confrers in Ireland. In addition to the Cork open trial on Whit-Monday, there are two-day open trials on June 25th to 26th and July 31st to August 2nd, particulars of which may be obtained by Mr. W. H. Freeman, 16, Fade Street, Dublin.

Imports and Exports.

Importations of motor cycles for April show a slight increase on the previous month, their number-475—being roughly speaking the average monthly importation for this year. During January, February, March, and April 1,937 machines were imported to Britain, and, although a comparatively small number, they no doubt helped to satisfy the shortage to a small degree.

EXPORTS.

There was a considerable decrease in motor cycle exports last month, the decline on the March figures being no less than 500 machines; the number exported for April being 1,139.

BRITISH EXPORTS, APRIL.

Special Features.

HILL HUNTING IN LAKELAND, OUR AMERICAN NEWS LETTER, LONDON EDINBURGH NOTES.

Are not Cars Big Enough?

Evidently the largest car is not bigenough for some motorists. Last week' issue of The Autocar illustrated luxurious' seven-seater saloon built on .1½ ton commercial chassis.

Fall in the Production of Benzole.

The Motor Legislation Committee poin out that, although no fewer tha 10,000,000 gallons of benzole were recovered from gas alone in 1918, in 191 the production fell to 3,000,000.

French Import Duty.

Motor vehicles weighing less than 2,500 kilogrammes had, up to Decembe 23rd, 1919, to pay a duty of 70% a valorem on being imported into France This was then reduced to 45%, and after wards to 334% ad valorem, but as th United States kept their duty at 45% their force of the control of the

For Motor Car Designers.

"The Automobile Engineer Year Book' (Iliffe and Sons Ltd., 20, Tudor Street E.C.4, price 6s., by post 6s. 6d.) ha now been published for the first tim since the war. The 1920 edition contain the usual features, having copious table of engine capacities, formulæ, and dat of value to the technical man. Tabulate details are given of British, Continental and American car chassis and Britis commercial chassis. An English-Frenc dictionary is incorporated.

Pillion Seats.

The number of pillion seats on the market will soon equal the number of makes of motor eycles,

A.C.U. North-western Centre.
A North-western centre of the A.C.U. has now been formed, consisting of clubs in Lancashire, Choshire, Flint, Denbigh, Carnarvon, Anglesey, and Isle of Man.

Carry your Licence.

Last week end there began a campaign for the examination of driving licences all over the country. Motorists were held up, sometimes in queues, for this pur-pose, and it behoves every driver to remember his licence before starting on

A Welsh Hill-climb.

A Welsh Kill-climb organised by the leading South Wales clubs will take place on Whit-Monday on the Black Mountain, Carmarthenshire. This hill, it will be remembered, figured in the last day of the 1919 A.C.Ü. Six Days Trials. The following classes will be run: Solo 250 c.c., 300 c.c., 500 c.c., 500 c.c., 500 c.c., and 1,000 c.c. Sidecars 750 c.c. and 1,000 c.c. The organising secretary is Mr. W. L. Perkins, The Pharmacy, Ystalyfera, Swanses Valley Swansea Valley.

Team Trial for "The Motor Cycle" Cup.

The thirteenth inter-club team trial for The Motor Cycle Cup, organised by the M.C.C., will take place on 26th June. Instituted in 1904 and revived in 1919, after five years of war, it is considered the "classic" club event of the year and will be looked forward to with enthusiasm by all clubs. This year, B. Alan Hill is the organising secretary. Full details will be published in *The Motor* Cycle next week.

ATTEMPT ON 350 c.c. TWELVE HOUR RECORD.

Last Thursday, F. A. McNab made a plucky effort to establish new record figures at Brooklands. He rode a 345 c.c. horizontally-opposed Wooler (standard model) and, after completing 144 miles 64 yards at an average speed of 40 m.p.h., he was compelled to retire with a broken connecting rod. It is hoped that his next attempt will be favoured with better luck.

A Fast Four-wheeler.

A feature of the Junior Car Club's race meeting held at Brooklands last Saturday was the outstanding success of the 10 h.p. G.N. This little four-wheeler secured five firsts and two seconds in the eleven events.

Works Lectures.

Last week we attended a works lecture at the O.K. factory, when several speakers gave their experiences of Russia under Bolshevist rule. This lecture was given in working hours, and proved most interesting.

COMPETITION DATES: A NORTHERN PROTEST.

Some Objections by the East Midland Centre of the A.C.U.

L AST Saturday a special meeting of club secretaries in the above area was convened at Sheffield to consider matters of vital interest in club life and to protest against alleged "organised opposition" being directed against the open reliability trial of the Ilkley L.C. and M.C.C. to be held on June 5th.

and M.C.C. to be field on June 5th.
S.Representatives of thirteen clubs in
Derbyshire, Nottingham, and East and
West Yorks were present, in addition to
members of the press and the motoring
associations. Mr. S. Raynes (Sheffield and
Hallamshire M.C.C.) presided, and Mr. J.
Simmonds (secretary East Midland Centre
4 C.II) bright described the corrections. A.C.U.) briefly described the correspondence which had passed between himself, Mr. T. W. Loughborough (secretary A.C.U.), and Mr. W. Pratt (trial secretary Surbitou M.C.C.) with regard to the clashing of dates between the latter club's team trial and the Ilkley open trial on

Mr. Simmonds mentioned that the three pen trials to be held in the district were to be mutually supported by amateur teams from each of the associated clubs, and that a broadcast invitation to compete in the Surbiton Club's trial on the same date as the Ilkley trial could only be considered as a serious clashing of nterests.

Mr. J. Norman Longfield (president likey C. and M.C.C.) amplified Mr.

Simmonds's statements. He reminded the meeting that of the twenty open events meeting that of the twenty open events decided upon for 1920 three only were allotted by the A.C.U. to the East Midland entre, despite the fact that the greatest number of clubs (twelve) were there represented. The North-western Centre, comprising four clubs, received two open tied dates. two open trial dates.

On April 14th a trial was announced for May 15th, open to amateur club teams, under A.C.U. permit, for a trophy presented by a trader, and to be held by the Surbiton M.C.C. This date clashed with the Liverpool Club's open speed trials, and an announcement was made in a daily paper that the Surbiton date was changed to June 5th, the date of the Ilkley reliability trial.

In view of this announcement the hon, sec, of the Ilkley Club forwarded a protest against the A.C.U. granting a permit to the new Surbiton club.

Strong feeling was also expressed con-cerning the fact that a policy of silence appeared to possess the press in regard to the matter. Notices of a meeting of protest were not published, and it was felt that the strong press influence on the Surbiton committee accounted for this, [So far as The Motor Cycle is concerned. no report of a meeting was received .- En.]

Mr. Longfield announced that the Ilkley club had already received sufficient entries to make its trial a success, and the protest was made purely on principle, largely with a view to urging upon the A.C.U. the advisability of preventing in future the inclusion of any A.C.U. official or member of the motor press on a club competitions committee.

On behalf of the A.C.U., Lt.-Com. Pierce speaking, as he said, rather as a sportsman than as a paid servant of the Union, cordially agreed with the senti-ments expressed, and regretted that matters had gone to the present length.

A long resolution was then proposed by Mr. Longfield, seconded by Mr. A. Walton (Leeds M.C.C.), and unanimously carried. The chief points were that a vote of censure be passed upon the action of the A.C.U. in permitting another club to hold a trial of the same nature as one already allotted for the same date. Also, that the A.C.U. should consider the undesirability of any member of its committee acting on a club's trial committee, and of the motor press being represented upon the ruling committee of the Union.

No drastic action will be taken until the end of the year, but, if it is still felt that the A.C.U. does not do more for the sporting side of the motor cycle move-ment to the North, the clubs firmly intend to break away and resuscitate the Northern Union of Motor Cyclists.

Lightweights Faster than Big Racing Cars.

74 m.p.h. with a 350 c.c. Single at Liverpool M.C. Speed Trials last Saturday.

An impression of E. Kickham, on his yellow 23 Douglas, crossing the finishing line.

DANCE has again swept the board by putting up the fastest times in every class, with one exception, in which he competed. This now famous young Kidderminster rider was the hero of the hour at Storeton, Cheshire, where. on a private road lent to them by Lord Leverhulme, the Liverpool M.C. held their annual speed trials last Saturday. There were no fewer than 300 entries for the thirty events, and although the actual number of competitors was only about forty, exclusive of the car entrants, the spectators did not tire of seeing these same men ride over and over again. Interested motor cyclists and several thousand of others, who journeyed to the Sunlight estate by trams, taxis, and on foot, showed the greatest enthusiasm right to the end of seven and a half hours' display of speed, such as few have opportunity to witness.

Fastest time of the day was made by Dance on his 3½ h.p. Sunbeam, when he covered the kilometre with a flying start at a speed equivalent to 76 m.p.h., a speed unequalled by the monster cars that came hurtling along the track in a manner perhaps more impressive than the greyhounds of the motor world with engines of one-tenth the size. The course was straight, level for the first half with a Tarmac surface, and on a slight up grade with an even surface of macadam, but covered with shingle for the latter portion. The change from one surface to the other was slightly disconcerting to a few of the less experienced riders, but on the whole the course can be said to be as good a speedway as is possible to find.

A light breeze blew down the course, and as the weather was entirely in favour of an enjoyable half-day's sport, it only remained for perfect organisation to make the whole proceedings the great success it proved to be.

The 300 c.c. Performances.

Some half dozen riders competed in the class for machines 300 c.c. and under (flying start), which was won by Pugh

(2½ Levis) at a speed of 58.3 m.p.h.—truly a good pace for a little two-stroke. Milner with his Diamond, having a converted J.A.P. engine with overhead valves, was not in his usual form, being placed second, having covered the course at a speed of 52 m.p.h. On formula, however, he was placed third, Lidstone (2½ James), who was third on time, taking second place.

Both Milner and Lidstone competed in

Both Milner and Lidstone competed in the 350 c.c. event, but since the winner's speed, with a 350 c.c. engine, was over 74 m.p.h., it was not to be expected that these miniatures would secure a place on time; but in the unlimited class, Milner succeeded in tying for third place against the cream of the meeting. His time was 34s.—a speed of over 65 m.p.h.—remarkable for an engine of only 250 c.c. In the standing start event for this

In the standing start event for this class later in the afternoon, Pugh again made fastest time, with Twentyman (2½ Diamond) second, and Lidstone (2¼ James) third.

Events for 350 c.c. Machines.

The first 350 c.c. event proved to be the fastest, Dance (Sunbeam) making his initial appearance on the course with a speed burst that seemed to surprise every one present.

A little later came Kickham on his yellow painted Douglas. It is safe to say that the great majority of the spectators had never seen 22 h.p. machines move so fast. The victor on time proved to be Dance whose speed was equal to 74.09 m.p.h., while Kickham's pace was 69 m.p.h.

In this event the T.T. A.J.S. made its debut ridden by H. C. Heath—and incidentally, though designed for a long event rather than a short speed burst, it tied for third place. Its performance was watched with interest by those who knew that the engine fitted was of a new design with overnead camshaft which is driven by a chain. Its speed was over 60 m.p.h.

As in the solo event, Dance made fastest time with the same machine with

sidecar attached, his time being 10s slower. Two A.J.S. lightweights of the type that won the last junior T.T. driven by G. S. Boston and G. Cowley respectively, came second and third, the former being 52s, slower than Dance In the standing start event, however with sidecars, Boston was only 3s, slower than Dance, who, with his 350 c.c. machine in the unlimited sidecar class, wo by the same margin from an 3 h.p. Zenith

the same margin from an 8 h.p. Zenth In the solo 550 c.c. standing start even Dance was again in competition with the yellow Douglas, and Heath's o.h.v. A.J.S. but his wonderful little Sunbeam again won 12s. from Kickham, Heath coming

third. The 23 Sunbeam and the 23 Douglamet again in the unlimited (standing start class, when Dauce repeated his forme performance, but Kickham lost 3s, on his time, repeating exactly the time he made against 500 c.c. machines.

It is interesting to view how consistent some of the times were, the best test of aggregate merit. This may be done briefly as under given in the order it which the various events where run:

G. DANCE (2) SUNBEAM).

Fastest time made in 500 c.c. Event.

In the first 500 c.c. event Dance made fastest time of the day (76 m.p.h.). For the first time A.B.C. machines and the new Duzmo were seen in competition by Northern riders. Le Vack (Duzmo created a very good impression for this MOTOR (YCLE

htweights Faster than Big Racing Cars .omising sporting mount, which, as many aware, has overhead valves and an taide flywheel. The hum of the B.C.'s certainly pleased the spectators, t each machine had a different note. ey would have done better had they not fiered from misfiring. Ultimately it Ultimately it

s found that the fastest four were: Time. M.P.H. 1, G. Dance (3½ Sunbaam) ... 2958. E. Kickham (2½ Douglas) ... 3258. G. A. Strange (3½ James) ... 3258. H. Le Vack (3½ Durmo) ... 20 ES. -76

I'wo of the riders in this event were of at cheery section of the community who re unfortunate enough to be maimed the war, and it speaks for their pluck ien a one-armed rider will ride a fast I. mount all out in a speed test. Such rider was E. C. Pencock, who rode a rton; the mount also chosen by B. freys who was minus a leg. Despite is handicap, however, Jeffreys secured and place on time in two events.

G. A. Strange, who was riding the ne 3½ twin James that he rode in the t "Six Days," and which he has used oughout the winter, made a very good owing, being grouped with Le Vack d Kickham for second position in both \$ 500 c.c. and the unlimited events. In dition, he was 1s. faster than the nuglas exponent in the 500 c.c. standing ire test.

V. E. Horsman (31 Norton) put up a od performance, and every time he ice. The following is a record of his

nievements on time :

MBH 65.4 55.6 57 48.3 e.e. solo, standing start . . 3 limited solo, standing start 3 (tie) 54.4

H. Le Vack was the only Duzmo rider

various classes, and, treated in the same manner, his record is as follows:

Pos Time, M.P.H. 67.6 55-5

Among the machines of the 750 c.c. class, the pre-war type 5 h.p. Matchless, ridden by J. H. Fox, covered the course solo at a speed equalling 65.5 m.p.h., and G. E. Stobart (5-6 James) in the 750 c.c. class did 56.7 m.p.h., and slightly improved on this among the unlimited side-cars, securing second place in both cases. He was also third in the unlimited standing start event, when his time was 45s. (49.7 m.p.h.).

The big twins did not figure conspicu-ously, A. J. Brewin's 8 h.p. Zenith being an exception. This rider tied with Dance's 23 h.p. Sunbeam in the solo flying start test, making fastest time in the big sidecar event and the run which was decided on formula, in addition to getting a second to Dance (2 Sunbeam) in the sidecars from a standing start. The only other 1,000 c.c. machine to be placed on time was S. A. Mark's Indian, which tied with G. Dance's 23 h.p. Sunbeam in the unlimited sidecars with a flying start, the speed being 55.9 m.p.h.

Neck-and-neck Racing

In the standing start events for solo machines the competitors were sent off in pairs, and several neck-and-neck races ensued, but the road was scarcely wide enough for such races at the speeds which present-day machines accomplish. In the final event duels were keenly enjoyed by the competitors, but in some cases difference in experience and acceleration capabilities quickly separated the duellists. V. E. Horsman (3½ Norton) was sent off with an A.B.C., but his "get-away" was much superior, with the result that a good gap existed between the two all the way to the finish.

It was during this last event—and very nearly the end—that the only accident in the races happened. Mr. Ralli (7-9 Rudge) had attained a high speed, and just after leaving the Tarmac stretch appeared to lose control. He swerved from side to side, and finally crashed, turning several complete somersaults before coming to rest, fortunately without the severe injuries one would suppose would accrue from a fall at speed.

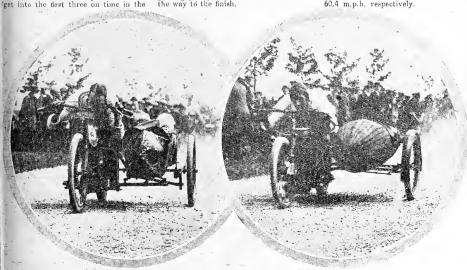

Another accident occurred after passing the finishing point. For some reason Simpkin (3½ Norton) did not slow down in the straight 200 yards allowed beyond the finish, after which there was a slight bend to the gates at the end of the road. Colliding with one of these, he was badly thrown, one of his boots being torn off, but without serious injury to his foot. He escaped with a rather severe shaking and several abrasions on the legs and hands.

The Cycle Cars.

50.5 m.p.h. was, the highest speed attained by the cycle cars. This performance was put up by A. Horrocks in the 1,100 c.c. flying start class on a 10 h.p. Morgan. His time was 44\frac{2}{5}\text{s}, and in the standing start 47\frac{2}{5}\text{s}. or 47.5 m.p.h. F. G. Ellis (10 G.N.) covered the course in 452s. (49 m.p.h.), and N. Svanso (8 Morgan) 48 $\frac{1}{5}$ 8. (46.5 m.p.h.). In the stauding start Svanso secured second place on time (53 $\frac{2}{5}$ 8., 42 m.p.h.) and J. Clegg (6 A.V.) third with 53 $\frac{4}{5}$ 8 41.9

m.p.h.
The results on time given are those announced on the course, and will be checked before the awards are made. several cases riders making fastest time will not necessarily be awarded the medal for this, as sometimes they were entered for formula only. Some of the speeds given, if confirmed, will constitute records. The flying kilometre records for 250 c.c. and 350 c.c. classes stand at 57.6 and

60.4 m.p.h. respectively.

FAST SIDECARS AT STORETON. G. S. Boston (2^a/₄ A.J.S. sc.) and V. E. Horsman (3^b/₂ Norton sc.)

The Western M.C.C. Open Hill-climb.

High Speeds on Good Surfaces.

E. M. P. White (32 Edmund) making fastest time in the 600 c.c. class. A fine speed impression.

THE Glasgow Western Club held its first open hill-climb on Saturday last, the venue being Garshake Hill, near Dumbarton. A very representative entry had been received for the five classes, which were as follow: (1.) Motor cycles up to 550 c.c.; (2.) Motor cycles up to 600 c.c. (3.) Unlimited. (4.) Sidecars up to 600 c.c. (5.) Unlimited. The surface of the hill was in excellent.

The surface of the hill was in excellent condition, and the large number of spectators present saw some very fine ascents. The star performance of the afternoon was that of Geo. Grinton (7-9) atternoon was that of Geo. Grinton (7-9 Harley-Davidson), who, in addition to obtaining fastest time of the day—29s. in the solo clase—made the fastest sidecar ascent, his time in the latter being 50\(\frac{1}{2}\)s. In Class 1, D. S. Alexander (2\frac{1}{2}\) Douglas) made a very fast climb, his time being 37\(\frac{1}{2}\)s. He was beaten on formula by W.

G. Smith (23 Ivy-Precision), who, in putting up the time of 385s., made a very clean ascent.

In Class 3, E. M. P. White (3½ h.p. Edmund) surprised everyone by doing fastest time in the class, J. W. Walker (3½ Norton), who was fancied for the event, being second. Walker, however, reduce the second of the control of the cont made amends in the unlimited class, clock-

made-amends in the unlimited class, clocking 51s., this being the fastest single-cylinder ascent, being only two seconds slower than the fastest time of the day.

Geo. Grinton (7-9 Harley-Davidson) made a very spectacular ascent in the unlimited class. Coming up the gradual slope to the bend at a terrific pace, he nearly ran into the spectators, finishing at speed. In the sidecar class he repeated his success, his time being 1\frac{2}{5}s. slower than in the solo class.

RESULTS ON FORMULA.

		Time.	Merit
I.	W. G. Smith (2] Ivy-Precision)	38 s.	230
2.	*D. S. Alexander (23 Douglas)	3725.	201
	CLASS 2.		
I.	J. W. Walker (31 Norton)	32 ls.	227
2.	*E. M. P. White (3! Edmund)	3115.	218

T.T. ITEMS.

The T.T. Nortons will have cha transmission.

The majority of machines in this year T.T. will be singles, the only exception being the Douglas and the Wooler in t Junior and the Indian Scouts, an A.B.(

Junior and the Indian Scouts, an A.J. and a 34 hp. Douglas in the Senior. Harmony has now been restored in t House of Keys. The I.O.M. Parliame met again last week to put through t necessary legislation to legalise the T.

The majority of machines in the Juni

race will have outside flywheels.

Belfast's representative in the T.T. w

be J. Shaw, who will ride a Norton. H. R. Davies, who tied for second.pla in the last Senior T.T., will ride a 2½ h overhead valve A.J.S. in both events. The Senior entrants now total twent nine, while thirty will ride in the Juni

event. R. Lucas will ride an A.B.C R. Lucas will ride an A.B.U.
Additional entries include Capt.
Lindsay (3½ Norton), J. Norman (3½ Norton), F. J. Redmond (3½ Indian scout)
N. Black (3½ Norton), and T. F. Clayt (2¾ Wooler).

The new taxation proposals habrought an avalanche of protest into copost bag. Every mail during the pmonth has contained bundles of lett from readers who fear that the addition standing charges will place the maint ance of a motor cycle beyond their mea Extracts given of our corresponder views will be found on page 571.

A big twin "all out" on Gershake Hill Dan Brash on his 7-9 Harley-Davidson.

The London-Edinburgh Run at Whitsuntide.

A Procession of Motor Cycles over Sixty Miles in Length. A Useful Time Table for Readers

THE entries for this year's London-Edinburgh Run constitute a record. No fewer than 382 competitors have signified their intention to compete. Solo riders number 168, sidecars 134, threewheeled runabouts 15, and cars 63. This means that before the last competitor is despatched from Highgate, the leading riders will be in Huntingdonshire, sixty miles away. Next week we shall give a complete list of starters; in the meantime, the following are lists of the various makes of machines in the trial and the numbers with which they are

The Route Time Table.

Below we give the schedule times of the official pilot car. The first competitor's time is half a minute later, the rest following at half-minute intervals. The pilot car, driven by Mr. W. H. Wells (29.5 h.p. Chandler), leaves Highgate at 8 to-morrow evening (Friday), the first solo rider at 8.0½, the leading sidecar at 9.26, and the first competing car at 10.42.

Our Lakeland correspondent made the ascent of Kirkstone Pass last week-end in order to gain first-hand knowledge of the difficulties with which the London-Edinburgh competitors will have to contend on Saturday. He reports that the surface has seldom been better.

Hints to Competitors.

The following hints by a member of this staff, who always competes in this event, may be found of service.

Competitors should not forget to wind their watches before the start.

It is best to drive with a little in hand,

so as to have plenty of time in case any adjustments are necessary on the road.

Spectators along the route are requested to place their lamps pointing in a northerly direction, so that they do not shine in the eyes of the competitors dur ing the hours of darkness.

Lamps should be amply powerful. Last year we suffered a great deal by having a good but rather small head lamp, which would have given plenty of light had one been riding alone, but the more powerful lights of others showed a shadow on the road for a considerable distance, which was most disconcerting. The ride is a long and strenuous one.

We advise competitors not to touch alcohol until the conclusion of the event. The stimulating effects of alcohol are only momentary, and leave the competi-tor more tired afterwards. There is always a good spread of food at the Swan Hotel, Biggleswade, and the coffee and tea which can be obtained there, as well as refreshments, are most sustaining for the night journey.

It would be perhaps advisable to take

on hoard spare carbide at this point.

The sun sets at 8.51 p.m., so that lighting-up time will be about 9.30 p.m., though, of course, there will be plenty of hight after this for some little time.

The sun rises at 3.1 a.m.

The moon will be three days from the first quarter; the new moon being on Tuesday.

Motor Cycle Research.

Splendid Progress of the Association.

UCH of the preliminary work in connection with the Research Association for the motor cycle aud cýcle car industries has now been done, and before very long the work of the Association will commence. Major Watling, of the British Cycle and Motor Cycle Manufacturers' and Traders' Union, advises us that the Association will not be confined to members of the Union, but open to others, provided they are British.

A large number of motor cycle manufacturers have definitely given their support to the Association, among whom may

be mentioned the following:
John Marston, Ltd. (Sunbeam).
New Imperial Cycles, Ltd.
New Rover Cycle Co., Ltd.
H. Collier and Sons, Ltd. (Matchless).

Norton Motors, Ltd. (A.J.S.).
A. J. Stevens, Ltd. (A.J.S.).
Ariel Works, Ltd. (Ariel).
Sun Cycle Fittings Co., Ltd. (Sun-Vitesse).

Enfield Cycle Co., Ltd. (Royal Enfield). Birmingham Small Arms Co., Ltd. (B.S.A.)

F. E. Baker, Ltd. (Beardmore-Precision). Ruby Cycle Co., Ltd. (Royal Ruby). Alldays and Onions, Ltd. (Allon).

Humber, Ltd. Portable Tool and Engineering Co. (Duzmo).

Phelon and Moore, Ltd. (P. and M.). Burney and Blackburne, Ltd. (Blackburne).

The Scope of the Association.

The work of the Association will not deal only with design, but will institute research right at the source, therefore tube manufacturers, including Messrs. Accles and Pollock and other producers of raw and semi-finished material, will be found among the members. Tyre manufacturers have a research association of their own, but every other hranch of the motor cycle industry will be represented by such firms as J. B. Brooks, Ltd. (saddles), Coventry Chain Co., Ltd. (chains), Best and Lloyd (lubricators, etc.), Tan-Sad Works (accessories), and several makers of lubricants.

It is to be hoped that the manufacturers of electrical units, such as magnetos, plugs, generators, etc., will join the Association in force, as it is obvious to all riders that these parts play an important part in the development of the successful motor cycle.

The user will be represented by a special sub-committee of the A.C.U., which body is pledged to give its support, and has shown the keenest interest in the work. The A.A. and M.U., as representing a large number of users, also might lend

For years it has been appreciated by both maker and user that such an association as this promises to be is not only very desirable, but absolutely only very essential if the British motor cycle is to hold its present position in the world of mechanically propelled vehicles.

Exeter M.C. and J.C.C.

Thirty members took part in a very enjoyable run to Chulmleigh on the 8th inst.

Ilkley M.C. and L.C.C.

Over 150 members of the Ilkley and Yorks Clubs were present at the suc-cessful gymkhana held at Collingham Bridge on the 9th inst.

Oxford University M.C.C.

The above club will hold an inter-University hill-climb on Kop Hill, Princes Risborough, on June 6th. Particulars of this event will be published at a later date.

Doncaster and District M.C.C.

A meeting was held at the Red Lion Hotel on the 11th inst., and the club's programme drawn up. The opening run will take place to Bridlington on Whit-Monday, starting from headquarters at 9 a.m.

Southport A.C.

This club is in a good position financially, and a comprehensive programme has been drawn up for this year. One of the principal events will be a speed test on the foreshore, which will probably take place on the 29th inst.

North London M.C.C.

Everything points to a most enjoyable Whitsun week-end being spent by members who will join the club in the run to Sonning-on-Thames on the 22nd inst. All necessary arrangements have been made regarding accommodation.

Worcester and District M.C.C.

A most successful social run was held on the 2nd inst. Between sixty and seventy enthusiasts journeyed from Wor-cester to Ross-on-Wye, where after tea some experimental hill-climbing took place on a steep bank.

Kidderminster M.C.C.

The results of the knock-out hill-climb, held at Hapton Bank on the 15th inst. were as follow: Class 1, G. E. Prichard (2½ Viper). Class 3, B. N. Norris (3½ Norton). Class 4, B. N. Norris (3½ Norton). Class 5, F. J. Adam (7/9 Indian).

Eastern Valley M.C.C.

This club held a successful fast hilltune care pera a successini last fillicimb on the 15th. The results of the two classes were as follow: Solo.—1, "W. Furnel (2\frac{3}{2}\) Douglas); 2, Miss F. Perry (2\frac{3}{2}\) New Imperial). Sidecars.—1, J. Williams (8 New Imperial sc.); 2, W. H. Olivar (6 Eufold sc.) Oliver (6 Enfield sc.).

Middlesbrough and District M.C.C.

Despite the rough state of the road on Ormsby some very good performances were made on the occasion of the hill-climb held on the 1st inst. The results were as follow: Class 350 c.c.: 1 C. (7-9 Indian sc.), 44 secs.

Manchester M.C.

It is the intention of the club to compete for the cup offered for the best attendance at the A.C.U. rally at Knutsford on the 23rd. Members will meet at the Nag's Head, Bucklow, at 2,50, when club colours will be issued before praceeding to Knutsford.

Lincolnshire A.C.

The motor cycle section of the above club will hold speed trials at Thonock Park, near Gainsborough, on the 29th.
Full particulars may be had from the
hon. secretary, Mr. W. F. Richardson,
"Hill Crest," Yarborough Road, Lincoln.

. Newcastle and District M.C.C.

Twenty-two competitors entered for the puncture-finding competition held at head-quarters on the 14th. Mr. Wood proved the winner, locating the pin hole in 24ss.

Dover and District M.C.C.

A motor cycling club has been started in the neighbourhood of Dover, to be known as the Dover and District M.C.C. The secretary is Mr. L. H. Hobday, Buckland House, Doyer.

Surbiton and District M.C.C.

The speed trial for the Low Cup and club medals will be a two-lap all comers handicap held at Brooklands on the 29th inst. The necessary arrangements have been made with the B.M.C.R.C.

Dewsbury and District M.C.C.

At a general meeting held recently at the club headquarters a presentation was made to Mr. A. Filton, who is shortly going abroad. Mr. Filton has presented a silver shield to the club to be won in competition.

Coventry and Warwickshire M.C.

On Saturday, June 5th, a reliability trial to Bath and back for the Manville Trophy has been arranged. Several noted hills will be included, such as Portway, Birdlip, Rising Sun, and Sudeley.

Goldthorpe and Thurnscoe M.C.C.

A new club has recently been formed in the Thurnscoe district. The hon. sec., Mr. F. N. Greenoff, Thurnscoe East, will be pleased to hear from any motor cyclists interested. The opening run will take place on the 30th to Cleethorps.

Greenock and District M.C.C.

Recently a new club was formed in Greenock and named as above. Any local motor cyclist desiring to join should get in touch with Mr. J. Duff, 44, Brisbane Street.

Middlesbrough and District M.C.C.

The results of the 100 mile reliability The results of the 100 mile renability trial for the Scott cup, held on the 8th inst., were as follow: 1, C. W. Smith (3½ Sunbeam); 2, J. E. Stoddart (4 Douglas sc.); 3, N. Wesson (7-9 Indian sc.); 4, J. McNamára (7-9 Indian sc.).

Keighley M.C.C.

On Saturday a hill-climb was held over a half-mile course on a gradient (maximum) of 1 in 63. The factest machines in each class were handicapped according to times in the final. Fastest time and winner of Coulton trophy, A. Jackson (3½ Norton), 46s.; 2, J. Spencer (23 Douglas); 3, E. Coulton (4 Trumph sc.). Fastest sidecar, A. Shuttleworth (7-9 Rudge ec.).

Helensburgh M.C.C.

The results of the recent hill-climb held' by this club at Garshake Hill were as by this ciud at Garshage IIII. were as follow: Class 600 c.c.: 1, D. S. Alexander (3½ Norton); 2, J. McIntyre (4 Triumph). Class over 600 c.c.: 1, D. S. Alexander (7-9 Indian); 2, J. B. Young Alexander (7-9 Indian); 2, J. B. Young (6 James). Class over 400 c.c. sidecars: 1, D. S. Alexander (7-9 Indian sc.); 2, A. McCulloch (6 A.J.S. sc.).

Important Notice.

Second-Hand Machines.

THE increasing demand for motor cycles and the shortage of supplies is a temptation to the unscrupulous to misrepresent the dates of second-hand machines, and sometimes these are advertised incorrectly.

The year of manufacture should be verified by reference to the makersthe engine number usually sufficing for this purpose.

Attention is also directed to our Deposit System which is intended for the protection of our reader.

BOUQUETS!

THE SERVICE CO. are constantly receiving letters from motor cyclists saying how pleased and satisfied they are with a purchase or deal concluded. This is the sort of thing that occurs daily in our ordinary correspondence:

"I must thank you for the prompt manner in which you obtained this for me after the makers had refused to supply."

"I would like to take this opportunity of thanking you for the kind and courteous treatment which I have received from you throughout, which comes somewhat refreshing when compared with the actions of other firms at this period of demand exceeding supply."

"I have already recommended you to one of my friends, who was able to obtain from you what he had failed to do in other parts of London, chiefly hecause you took interest in his requirements, and finally 'unearthed' what he was looking for."

"I feel I must write to thank you for the most conrecous treatment I received at your hands. Although you were swarming with purchasers and very busy, nothing seemed too much trouble for you to take or to satisfy me."

".... This is surely a testimony to the thorough way you overhaul."

We always have a large number of machines in stock. Why not come and look round—there may he something to suit you—or we can talk delivery of the machine you want. They're coming along better now.

MAINTAINED

The high standard of efficiency which this fork affords, and maintains in use, has proved to be an invaluable acquisition to the personal comfort and safety of motor cycle riders, also in minimising the wear on tyres, and prolonging the life of their machines as a whole; and, as a natural sequence, equally invaluable as a selling point to motor cycles on which they have been fitted, with the result that the requirements of manufacturers who are now fitting The Brampton Bi-Flex as a standard fitment to their machines. Fully descriptive booklet free on request from—

"Taking it out for a walk, Bill?"

And the gentleman with the cold perspiration bespangling his brow stopped: looked as if he would like to murder his questioner. then pulled himself together and replied:

"No, you blanketty, blanketty idiot, but when you've got a broken Belt Fastener and no spare - well, you've got to walk it."

But you needn't have it, and the surest insurance against such a disaster is the

FORWARD

Fastener—

the Fastener that never fails.

There are two models - the FORWARD price 1/9, and the KING HOOK, detachable 1/6, adjustable 1/9.

And you should ask for Booklet.

FLEXEKAS

An air leak preventer and valve stem lubricator that requires no packing,

The fitting consists of an airtight flexible spring casing enclosing the valve stem; the top end fitting into a special copper cage, which abuts the

The casing is supplied filled with special heat-proof graphite paste.

PRICE 2/6 EACH.

When ordering, state make and year machine.

ECONOMY. Your carburetter jet is necessarily large to allow for leakage by the valve guides especially if worn.

EASY STARTING. Nothing worse than air leaks. SLOW RUNNING. Ditto, especially if some guides are worn worse than others.

LUBRICATION. Saves infection and wear at a vital spot neglected by manufacturers, and if

vour valve guides are good seeps them so.

QUIET RUNNING. The result is remarkable.

GENERALLY. Fit on all valves and you obtain
a sweeter valve motion with elimination of
valve bounce. Cheap, easy to fit, efficient, they last for ever.

Obtainable direct from the patentee:

CLIFFORD PRESSLAND, A.M.I.E.E., Engineer. HAMPTON-ON-THAMES.

T.T. Prospects.

HE fact that certain firms have refrained from entering machines for the forthcoming Tourist Trophy Races certainly tends to make the entries rather less representative. At the same time sufficient entries have been received to ensure a good race, and nearly all the firms who have been conspicuously successful in recent events are represented by their own or by private riders. It is unlikely that a large number of entirely new engines will be seen in the island races, though there will be a few employing the very latest features of design.

It is safe to say that at least one firm will employ aluminium in their cylinder construction, and that there will be a tendency towards the use of well arranged overhead valve gear. Generally speaking, the entries for the Senior event will consist of well-tried single-cylinder engined machines, but there are sufficient newcomers, especially amongst the twins, to lend a very considerable interest to the race.

It is likely that the speed of the winning Junior will be not far short of that of the Senior winner, since the maximum speed is limited by the nature of the course. . The performances of the two-strokes, both 350 c.c. and 250 c.c., will be watched with interest, and it is likely that their speed and stamina will prove a revelation to many.

It would be hard to pick a winner in the 1920 events, but, apart from the questions of luck and organisation, it must be remembered that the chief factors which make for success are reliability, acceleration, and a rider who knows how to restrain himself as well as how to ride fast. The T.T. course is not a fast course, and, in spite of the fact that very high speeds are attainable in certain sections, the number of corners and curves which require careful negotiation at high speeds render a really fast average almost impossible.

With the rest of the sporting element in motor cycle matters, we look forward with keen enjoyment to these classic races and know we are expressing the thoughts of both private and trade owners when we say "May the best man win."

International Six Days Trial.

E have already published a précis of the rules governing the International Six Days Trial, which is organised by the Union Motocycliste de France, and is to take place from the 25th July to 1st August. Many will remember this trial as the event which was unfortunately postponed owing to the outbreak of war in 1914. On that occasion Great Britain was well represented, but at the present time the support for such competitions is particularly difficult for manufacturers, as the whole of their energies are devoted to output.

Due consideration must always be paid to the requirements of Overseas riders, and a trial over Alpine roads must be of inestimable value to manufacturers. Machines which will ascend a fifteen-mile Alpine pass without overheating will, perform equally well elsewhere. It must be remembered that the feature of these long climbs is the extreme length rather than the maximum gradients; even the Col de Galibier, the stiffest of the main roads, has no freak gradient, but it is the steady climb for many miles which renders it more difficult than any hill in this country.

The ill-fated Paris-Nice Trial has undoubtedly left a båd impression amongst English manufacturers. The International Six Days, however, is on a very different basis. The trial is organised by the Union Motocycliste de France, which is the accepted governing body for the French sport, and is recognised by the International Federation of motor cycle clubs, whose secretary is also the secretary of the British Auto Cycle Union.

T.T. Bars.

THE ardent novice who specifies T.T. bars often fails to realise that, in the event of quite a mild tumble, the heavily-dropped bars will dent the petrol tank, and that if a heavy crash befalls the 'bus they will very probably perforate it. The so-called "semi-T.T." bars usually have just enough height to clear the tank, but manufacturers' terminology is not standardised, and some T.T. bars do not clear the tank, whilst in one or two cases T.T. bars clear the tank because the top tube has a steeper slope than is usual. I mention the matter for the information of purchasers, and also with faint hopes that nomenclature may be made more definite.

Watch the Oil.

S everybody knows, a compound of experience and observation is needed to acquaint a Scott rider with the amount of oil on board his machine, since it is stored in the frame tubes, and the level cannot be My pump plunger bounced up the other day, signifying empty tubes, but luckily I was passing through a town, and stopped at a garage to buy a quart tin of Vacuum T.T. I was interested in the charge, since I normally subsist on big drums of oil, several of which are relics of happier days when oil was comparatively cheap. Three shillings and eightpence for a quart of oil, gentlemen! It was certainly a horrible war. As my pre-war drums are running low, I shall take an oath never to overlubricate in future.

Some Watersplash.

HAVE performed few feats in my life which were worthy of being filmed, but no Los Angeles stunt merchant has ever excelled a quite involuntary show of mine last week. I was trying out a brand new machine which is rather hot stuff, and the road was new to me. After an hour or so I was still thirsting for a change to get the throttle wide open when I arrived at a long straight piece of going, which fell gently down into a valley and climbed gently out the other side. There wasn't a soul or an animal in sight, and, after one gleeful glance through my dusty goggles, I flattened down on the tank, and let the machine rip. I was doing rather more than a mile a minute as the bottom of the dip rushed up to meet me, and only at the fifty-ninth second of the fiftyninth minute of the eleventh hour did I realise that the somewhat odd look of the road surface in the dip was a watersplash. It was too late to stop. depth of the water was problematical; also the kind of surface which lay beneath the water. All I could do was to hang on like grim death and trust to luck. The water came up and hit me like a solid wall. I emerged, stunned and dripping, but erect, a wiser and more prayerful man.

Back to Gas Lighting.

FTER a spell of electric lighting I have jus reverted temporarily to gas lamps, since the Lucas Co. is behind deliveries of the special Magdyno designed for use on two-stroke engines. dug out an old Lucas gas set, which I bought in 1913 and fitted it in ten minutes or so. Naturally I'di not feel too comfortable, as I had forgotten how muc water drip to give, but it functioned with perfect reliability, though it had lain rusting in a corner of the garage for six years. On the other hand, th illumination was noticeably inferior to that of elec tricity. The light was flung too high, and not fa enough, though I might have improved this if ther had been time to experiment with the focussing, whic is adjustable. My chief complaint was that the gener ator was not automatic. In energetic days I hav been known to do a little lecturing with a magi Lanterns employ a tank generator whic feeds four big burners without attention for two hour without a flicker, and without attention. Neither i lighting up, nor as the entire charge of 2 lb. or mor begins to get sodden, is any adjustment required. Thi is obviously an ideal for motor cycle generators. Wit my resuscitated 1913 generator I got a fairly stead light and a fairly economical carbide consumption but only at the price of fiddling with the water fee every mile or so. In night riding, especially o strange roads in winter weather, one has quite enoug occupation without attending to the lamps. doubt if I ever handled an automatic motor cycle ger erator, except the Low patent; and on occasions the instrument has been known to be whimsical. I suppos all supply difficulties in connection with electric light ing will be at an end by next season. But the facthat some such outfits constitute a £20 extra mus restrict their popularity; and there is surely a gres opening for a generator which will burn for fou hours without attention on half a pound of carbide Incidentally, some garages are surely profiteering i carbide? The other day I bought 1 cwt. of carbid retail for 45s., but saw a rider charged 1s. for 1 lb Mine, purchased in bulk, cost me no more than 43/d per lb., which includes a retailer's profit.

A Correction.

R. Alan Fenn, of the Sopwith people, asks m to correct a remark I made the other wee about the "options" on A.B.C. machines Manufacturing difficulties were responsible for th delivery of a few machines without kick-starters, an in each case the customer was given the choice betwee waiting or having the accessory added later on. From now on every cycle will be sent out with a kick-starter Similarly, the electrical equipment can now be supplied to anybody who wants it.

Lining up Scott Chains.

INCE I betrayed my ownership of a Scott, I have had a lot of correspondence from fellow enthusiasts, and several of them ask advice on uring chain alignment after dismounting the gear changing sprockets, etc. "Tim" Wood is of inion that it is practically impossible to get the ains out of alignment with the spindle nut and llow bolt tight, but in any case alignment can easily verified by taking the measurement from the bolt Idling the crank case door strap on each side. My rrespondents should refer to page 150 of the entieth edition of "Motor Cycles and How to anage Them," where they will find a sketch of a ding tin gauge for measuring the distance between ankshaft and countershaft centres on either side.

Rust-proofing a New 'Bus.

KINDLY correspondent denounces me as a slovenly and wasteful fellow for using anything so glutinous as I rices' hub lubricant to rustoof my new 'bus. Apparently the gentlemanly ethod is to dissolve a tallow candle in three or four nes its volume of petrol. A milky solution results, nich is rapidly brushed over the plated parts of the achine (i.c., over 99% of its superficial area). In out ten minutes the petrol evaporates (surely my iend has been using aviation spirit?), and the thin m of tallow alone remains. This dodge can be polied to tools in storage with huge success. The me reader is wildly enthusiastic about the cigarette noke test for air leaks published in our columns the her week. He tried it in a somewhat cynical spirit, it wisps of smoke curled from all sorts of unsusected places. He has already purchased a new inlet the and guide as the result of the experiment, and is ow feverishly studying our recent lucubrations on the ibject of eccentric v. concentric piston rings.

Punctures.

THANKS perhaps to the quality of modern tyres, but more probably to frequent changes of machine, I had not sustained a solitary puncture om the Armistice until last week. Then I struck one f the sort from which we all hope to be immune uring a Six Days. A pukka pinhole doesn't matter. ou can blow up every five miles until you meet a

water trough or brooklet and can trace the hole. A real gash takes no finding, and with luck will not be too big to patch. But this puncture of mine was betwixt and between. I couldn't see it nor hear the hiss of escaping air, particularly as it befell on a lonely moor, where the telegraph wires were singing maddeningly in a thirty-mile wind. On the other hand, periodic dismounts to pump up were no good, as each inflation lasted about five hundred yards. When my stock of swears had been dumped, I took my fate in my hands, and blew the tyre up till it resembled Joe Beckett's forearm. The staunch rubber held, and at last I spotted a teeny hiss. The makers of the machine had provided no tyre outfit, and the local garage was out of Patchquick, so I had invested in a kit which is new to me-the John Bull. I have never used a solution which dried more quickly, and was very pleased with the speed of repair made possible.

Security Bolts? WHILE I am talking of tyres, has anybody else found that tyres have a distinct tendency to creep round the rims in this year of grace? It is aggravating enough to have to unfit a tyre because it is punctured, but when you notice that a tyre valve has ceased to be part of a radius, and is slanting about all cockeye, you get doubly mad: at least I do. I was quite familiar with this particular trouble a few years ago, and when it wasn't due to my running my tyres too soft, it was ascribable to discrepancies between makers' rim and cover sizes. All that sort of evil is supposed to have been scotched by the present standardised moulds and presses; but, if my experience is valid, quite a lot of "creeping" still goes on. I can only ascribe it to the terrible wrench administered to the back tyre by the frightful acceleration of which some modern hot-stuff engines are capable. On two 1920 machines I have often felt the back tyre scrabbling for road grip on dry surfaces when I banged the throttle open on a lower gear after taking a sharp bend followed by a stiff grade. I take it that if the cover is immovable in the rim, the inevitable slip is between road and tyre, but that if the locking of the cover in the rim is just not perfect, the cover creeps. I hope we shall not be driven to use security bolts on hot-stuff machines. Let me hastily add that I haven't been pot-holed into letting too much air out of my tyres, as readers will possibly suspect.

A CLOSE FINISH.

H. R. Godfrey winning from C. Finch at the last Brocklands Junior Car Club's meeting. Both were driving G.N cycle cars, the winner averaging 499 m.p.h.

The International Six Days Trials, July 25th to August 1st, 1920.

Scenes typical of the Route and a Preliminary Notice of the Regulations.

NDER the organisation of the Union Motocycliste de France, the International Six Days Trial will commence on July 25th at Grenoble, and radiate from the same place on three succeeding days. 220 to 250 kilometres (137 to 155 miles) will be covered each day. On the fifth day (July 29th) the machines will be exhibited to the public, and the sixth and seventh days will be occupied in the journey from Grenoble to Paris.

Each day, at the start, the competitors will be allowed fifteen minutes for replenishments and adjustments, and all other repair must be done in running time.

The average speed to be maintained is 30 km.p.h. (18) m.p.h.) for machines and cycle cars, and 28 km.p.h. (17½ m.p.h.) for sidecars, except in the two days journey $(17\frac{1}{2})$ to Paris, when all vehicles must average 30 km.p.h. There are classes for 350 c.c., 500 c.c., 750 c.c., and 1,000 solo motor cycles, 500 c.c., 750 c.c., and 1,000 c.c sidecars, and 1,100 c.c. cycle cars, and minimum tyre and mudguard sizes are specified in class

> (Top) Scene near Espinasses, showing the road washed away by an avalanche. After such occurrences the road is gradually rebuilt by the villagers. In the distance can be seen the village of Renollen.

n the French Alps.

The machines will be weighed t Grenoble, and all essential us will be spare parts, which

Competitors must take out

nsurance policies to cover all hird party and fire risks.

During the trial a number of special tests will be made, ncluding brakes, time over a ill-climbing. The routes will be divided into 40 km. (25) niles) controls, and at each the competitors must stop to have he time marked on the route ard. An allowance of five ard. An allowance of five minutes early or late will be nade, beyond which one mark vill be deducted for each minute of error. Any competitor who is one hour late at any con-

rol will be deemed to have retired. Efficient lamps must be carried, is there are many tunnels in the nountain sections; the surface in hese is mostly greasy, and a light afety. At all places of difficulty rrows will indicate the route.

One thousand marks will be

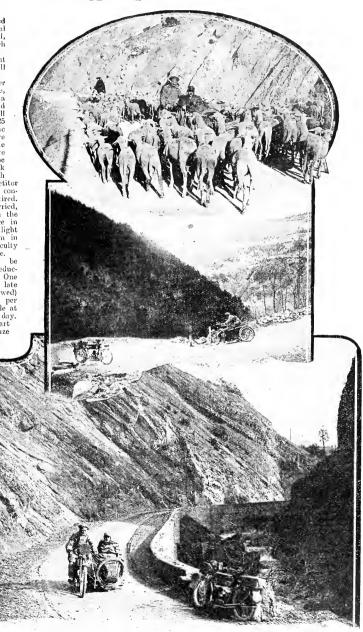

dlotted to each starter, and deduc-ions will be made as follow: One nark per minute early or late beyond the five minutes allowed) t any control. One mark per ninute early or late of schedule at unch stops or final stop of day. The marks for each spare part used. Gold. silver, and bronze nedals will be awarded.

In addition to the Six Days Trial for addividual riders, the international Touring Frial will be run contrial will be run con-urrently. This is pen to teams of three riders of any country affiliated to the International Federation of Motor Cycle Clubs, The f two solo machines ot exceeding 500 c. and one sidecar r cycle car. Entries or the trials close in June 15th, and particulars can be btained from M. le Bécrétaire, de Union Motocycliste le France, 8, Place le la Concorde, Paris.

THE TOURIST TROPHY RACES.

Details of the Great Races in the Isle of Man. Sixty-one Entries Received. Exceptionally Keen Contests Expected.

SENIOR RACE, THURSDAY, JUNE 17th.

Distance 225 miles. Six laps of 37 miles 4 furlongs each.

First Prize: The original Tourist Trophy, presented by t Marquis de Mouzilly St. Mars, to be held for o year; £50 in cash.

Second Prize: £25 in cash.

Third Prize: £15 in cash.

Special gold medals to every competitor finishing with thirty minutes of the winner.

Team Prize: To be won by a nominated team, who me all finish the course within thirty minutes of t winner

Present holder: Cyril G. Pullin (31 Rudge). Time, 4h. 321 48s. Average speed, 49.49 m.p.h.

In both races competitors are required to wear a reg lation racing helmet. As there appears to be a shorta of this very necessary headwear, the A.C.U. makes an appe to all who possess helmets to help it out of this difficulty l communicating with the secretary.

Practising starts at 4.30 on Monday morning next (Ma 31st), and will be continued up to the morning of Monda June 14th, Sundays excluded.

SENIOR ENTRIES.

JUNIOR RACE, TUESDAY, JUNE 15th.

Distance 187 miles 4 furlongs. Five laps of 37 miles 4 furlongs each.

First Prize: Trophy to be held for one year, £40 in cash, and special gold medal.

Second Prize: £20 in cash.

Third Prize: £10 in cash.

Special gold medals to every competitor finishing within thirty minutes of the winner.

Team Prize: To be won by a nominated team, who must all finish the course within thirty minutes of the

Present holder: Eric Williams (23 A.J.S.). Time, 4h. 6m. 50s. Average speed, 45.58 m.p.h.

SPECIAL 250 c.c. CLASS.

In addition to the above-mentioned awards, the riders of machines with engines under 250 c.c. are eligible for competition for *The Motor Cycle* trophy, presented by the proprietors of this journal with a view to encouraging the development of the small lightweight machine. The finishing time limit for the gold medalists in this class will be calculated from the time which the fastest machine of the class finishes the course.

* In 250 c.c. class for The Motor Cycle Trophy.

Two-strake and four-stroke engines are indicated 2-st. and 4-st. respectively. The flat twins are all four-strokes.

T.T. ITEMS.

The Nortons entered are practically standard racers.

The new Comet entered for the Junior event is a two-stroke fitted with a Climax engine of 293 c.c., and is of

practically standard specification.

The A.J.S. machines have overhead valves. Two types have been made: one with the usual push rods, and the other with an overhead camshaft driven by chain.

The Indian Scouts will be the only V twins in the race

this year. Flat twins will be represented by the A.B.C. and the 3½ h.p. Douglas in the Senior event, and by the Woole and the 2¾ h.p. Douglas in the Junior race. Comfort counts in a T.T. race. It will be interesting to note the performances of the spring frame mounts.

The Liverpool M.C. Speed Trials Results.

Awards on Time and Formula of the Racing at Storeton.

THE highly successful speed trials organised by the Liverpool M.C., which took place at Storeton on the 15th inst., were recorded in our issue for the 20th. We are now able to give the official results n time and formula, which are as under:

ELIANCE OPEN SPEED CHALLENGE CUP. For the best aggregate performance by a motor cyclist in open classes, using the same machine. Previous holders: 1913, G. E. Stauley (Singer); 1914, C. R. Collier (Matchless). G. Dance (2) Sumbeam).

AXTER MEMORIAL CUP. For the best aggregate performance by a private owner. G. S. Boston (23 A.J.S.).

OOPLAND CUP. For the best performance by private owner who does not win Reliance or Baxter Cups.

A. J. Brewin (8 Zenith).

osron Cup. For the best aggregate performance on formula. G. Dance (2 Sunbeam).

PECIAL PRIZE FOR FASTEST TIME OF THE DAY. G. Dance (31 Sunbeam). SACHINE TEAM PRIZE. A.J.S. and Norton tied.

Roadside Courtesy.

URING a recent holiday week-end I had the misfortune to be consigned to the high road for a four hundred miles there and back trip, and the experience afforded a superb opportunity of studying the modern aspect of things as regards the muchdiscussed "old-time courtesy of the road."

From Carlisle to Settle the road was literally strewn with roadside wrecks in every stage of senile decay, and I began the day by courteously slackening down, with the usual humble enquiry. Generally it brought no response; sometimes an "all right" in a "mind your own business" manner.

Now the majority of us, who do not break down at the roadside as a usual thing, and who probably do not require help if we do, since we carry all things necessary, enjoy such immunity simply because we pay for it in hard cash and caution. We go to some small

expense, and exercise a good deal of methodical care in order to avoid roadside annoyance, and, having done so much, I really fail to see why we should be considered callous because we refuse to burden ourselves with the troubles of everyone who, through his own incapability or closeness, is utterly incapable of passing from one town to the next without spreading himself out in the grit.

These things being so, and the amount of motor cycle traffic having so enormously increased, it is full time some fresh understanding were arrived at regarding roadside help, and the obvious way out of it is for all roadsiders to be considered O.K. unless some signal of distress be given to passing traffic. Any rider, I think, would be only too happy to stop if he were sure his help were really needed-if he were sure no cool CHINOOK. rebuff awaited his offer.

MOTOR (YCLE

THE T.T. IVY.

A 348 c c. Two-stroke with Three-speed Gear and All-chain Drive.

ONSIDERABLE interest is being manifested in the chances of the two-stroke engine for the forthcoming Tonrist Trophy Races, and the performance of the 3 h.p. Ivy, one of few 348 c.c. two-strokes entered for the Junior Race, is bound to attract the attention of all enthusiasts. In 1914 the only Ivy entered put up a very creditable performance, and averaged over 30 m.p.h., in spite of its tiny engine capacity of 269 c.c.

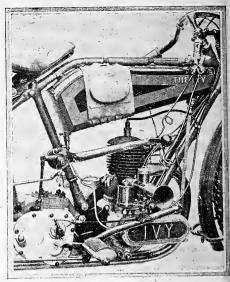

Roller Bearings.

The 1920 T.T. Ivy has a cylinder of 75×79 mm. bore and stroke, giving a swept volume of 348 c.c. The crankshaft runs on roller bearings throughout, and runs on roller bearings throughout, and peculiar care has been taken in designing the ports. The exhaust gases are provided with a free, and mobstructed flow, and we hear that the acceleration and speed of the little machine are exceptional. Externally, the most noticeable features are the copper tubes inserted in holes drilled through the radiating fins, and the neat method of foot operation for the oil supply.

An inverted sight feed drip is arranged in the front end of the tank, the pump

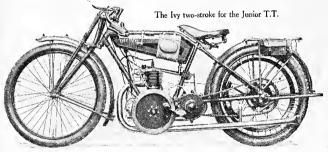

spindle projecting downwards. This spindle is attached by a length of strip steel to the front end of a bar. The

bar is pivoted on to the footrest, and carries a pedal near its centre, which may be depressed by the rider's right toe. From the sight feed there are two leads, one to the cylinder and one to the crank case, and the flow of oil to either or both of these leads is regulated by a tap. A three-speed Sturmev-Archer gear box, giving ratios of 4, 5, and 7½ to 1, and having a single-plate cork clutch is used, the drive being by chain throughout. In addition to the usual front rim brake, two shoes, actuated by the right heel or left toe, are arranged so as to operate independently on a dummy belt rim. A tank of the distinctive Ivy shape and having a fuel capacity of well over two gallons is fitted, and large quickly detachable filler caps are incorporated.

Having a 343 c.c. engine, the lvy will be one of the largest two-strokes in the T.T. this year.

Other features include a cush drive in the rear wheel, 26×23in. tyres, Brooks B220 saddle, and an enclosed release valve. Additional interest attaches to the Tourist Trophy Ivy engine, in that it is the forerunner of the 1921 Ivy models, and in no way differs from what is to be the standard engine for the roadster models. The finish throughout is excellent, and there are no signs of the usual T.T. rushed work.

ROAD RACING IN FRANCE

THE Lyons Motocycle Club, which is one of the most energetic of the French provincial organisations, recently held a road race over a 9 mile course in the neighbourhood of the silk city. Solo machines of 250 c.c., 350 c.c., and 500 c.c. were admitted, as well as sidecars of 500 c.c. and 1,000 c.c. The number of laps to be covered varied with the class of machine, being the highest

for the 500 c.c. solos.

The highest average in the race was made by the professional rider Vulliamy on a 350 c.c Alcyon, his speed working out at 53 m.p.h. In 500 c.c. class the fastest rider was Pean, the Pengcot champion, who, with his overhead valve racer averaged 50.6 m.p.h. for the entire distance, and covered one lap at 57.7

In the sidecar class the winner was Mazuel, on a Harley-Davidson, who averaged 41.7 m.p.h. Detailed results are as follow:

TRADING WITH FORMER ENEMY COUNTRIES.

The following resolution has been passed by the Council of the British Association of Trade and Technical Journals, Limited:

"In view of the expression of opinion by Sir Auckland Geddes, as President of the Board of Trade, regarding the acceptance of advertisements of goods manufactured in late enemy countries, the Council have carefully considered the whole position. Thy now recompolicy of the Association not to accept such advertisements for the present, in order to enable British manufacturers to recover their normal working conditions, At the end of the present year (1920) the subject will again be considered, with a view to further advising members on the subject."

The publishers of "The Motor Cycle" readily accept this recommendation, and have, in fact, constantly refused offers of advertisements of German goods.

A Midland Test of a 3 h p. Spring Frame Royal Ruby.

SALIENT FEATURES OF THE ROYAL RUBY.

ENGINE: 3 h.p. Royal Ruby, 74.5 × 80 mm., 349 c.c.

GEAR: Royal Ruby two-speed countershaft. LUBRICATION: Best and Lloyd drip feed. FRAME: Royal Ruby patent spring frame. TRANSMISSION: Chain-cum-belt.

WEIGHT: 220 lb. approx. PRICE: £109 14s. 6d.

IN these days, when the motor cycle power unit has reached such a degree of perfection that one ceases to worry about mechanical failures, manufacturers are devoting more attention to the important questions of comfort and cleanliness. With our very uncertain climate and the present state of the roads throughout he country, good springing and reasonable protection rom mud and wet are an absolute necessity to the all-weather motor cyclist.

Those who followed motor cycle patents during

he past year or two would note hat the Ruby Cycle Co. was devotng its energies to a design incororating, amongst other features, an ffective springing system. This reulted in the production of the two nodels which attracted so much ttention at Olympia.

Recently we availed ourselves of he opportunity of giving one of these nachines an extended road trial, the nodel chosen being the 3 h.p. singleylinder solo mount with two-speed ear, chain-cum-belt drive transmision, sprung front and rear by single aminated springs.

On the Road.

Our test consisted, amongst other ems, of a hundred-mile run in con-

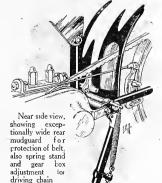

nection with the recent Victory Cup Trial, though, besides this, the machine has been driven for a considerable mileage over the roads and lanes of Warwickshire, which afford a variety of conditions for testing the merits of the spring frame. As our object . was to observe the competitors on the tricky ascent of Rising Sun, Coventry was left at noon, allowing two and a half hours for the journey of fifty miles, and, not wishing to "push" a new engine unduly, we declined the offer to start later in company with a

fast 31/2 h.p. flat twin and two power-

ful sidecar outfits.

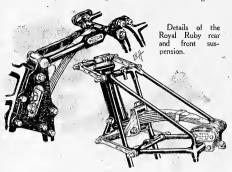

Rain had fallen all the morning, . and continued to do so throughout the earlier part of the journey with a persistency so well known to all motor cyclists. Pushing along the rough Kenilworth-Warwick road one was at once impressed by the way the machine seemed to float over the bumps and pot-holes, and our thoughts went back to the vile roads and pavé of other days. For the first few miles we found the machine somewhat strange to handle, but this lack of handiness is not so noticeable when one has got to know the machine, except at slow speeds.

Arriving at Stratford-on-Avon, we found the historic old town gaily

Road Tests of New Models .-

bedecked with flags in commemoration of the birthday of the Bard of Avon. We did not dally, however, and, after crossing the birdge, headed for Broadway with increased speed. The little engine answered the throttle well, and, though new, showed no signs of

drying up after a long climb or burst of speed. It runs very smoothly and quietly up to 25 m.p.h., and has a maximum speed of something over 40 m.p.h., at which speed the machine is particularly steady. We overoiled consistently all the way, but failed to make the engine smoke.

The clutch is exceptionally "sweet," the lightest touch of the lever taking away any perceptible snatch when driving dead slow on "top." All hills were taken comfortably on top, with the exception of the last steep stretch of Cleeve Hill, when the low gear was engaged. changing would be rendered easier by a slight alteration in the position of the gear lever, and would possibly be facilitated if the lever were situated at the side of the tank. The descent into Cheltenham afforded opportunity of testing the rear brake, which we found quite effective, the large pedal being conveniently placed to allow the heel to rest on the

footboard when descending a particularly long gradient.

Commendable Mudguarding.

Arriving at Rising Sun, we found ourselves reasonably clean after the wet ride, and our appearance compared very favourably with many riders we saw during the day. In short, mulguarding is well carried out. The back guard is wide, and overhangs the belt rim, thus protecting the latter to a certain extent. The from guard is deeply valanced, and with the large undershield gives ample protection to the rider and engine.

Before long a little knot of interested motor cyclists had gathered round the machine, and for five minutes

we were plied with questions concerning its comfort.

Returning by the same route, on favourable, roads, we opened out, and mile after mile was reeled off with the speedometer needle half-way round the dial. The road was quite dry, and no attempt was made to pick the way, pot-holes and bumps being taken without any reduction in speed. Quite a number of motor cyclists were returning, and we found the machine able to hold its own with anything of similar power.

We arrived home just before eight o'clock, having completed the journey in under two hours, and, on calculating the petrol consumpton, found it worked out at something over 105 m.p.g.; quite good, considering the machine was new. The Royal Ruby engine has won excellent opinions during its stay in The Motor Cycle garage; it keeps cool, is noticeably quiet, and readily responds to the throtttle.

An "Overseas" Mount.

Regarding special points, a feature which will appeal to Overseas riders is the high ground clearance of the whole power unit. The Royal Ruby, especially the 8 h.p. model, should be particularly suitable for Colonial conditions where a strong well-sprung frame ample power, and high engine clearance are absolutely essential. Other noteworthy features are adjustable footboards, giving a very comfortable riding position patent gear box adjustment, spring stand, and large carrier toolbags.

(Left) All kinds or roads were traversed during the road test, including grass banks, as shown in the illustration.

(Right) It will be observed that the ground clearance of the engine is sufficient to qualify this model for Overseas use.

A Commentary based upon Practical Experience and a Study of Overseas Opinions

Trials Help?

From almost every out-of-way corner of the earth we receive complaints that the British machine does not quite fill

the requirements of the man who has to do his own pathfinding. Perfection, of course, is an impossibility in this world, and it is not urged that other countries deliver machines which are in every way blameless. During 1919 and 1920, reliability trials in this country have been stiffened up to such a degree that it becomes unbelievable that a motor cycle could be used habitually under worse conditions than those encountered on the routes selected by trials committees.

As a result of the trend of trials organisation, which first became noticeable in the latter part of 1913. transmission has almost entirely changed, wheels and frames have been strengthened, and tyre sizes have increased.

4 4 4

Direct Result of Public Testing.

As an outcome of the type of reliability trial with which the makers have perforce entered their machines, the once popular belt drive, gave place to the chain-cum-belt transmission, which, in turn, has almost disappeared in favour of chains alone. Even the early exponents of chain drive have added improvements, such as the completely enclosed chain case, the mechanical shock absorber, and the instantly detachable wheel with independent driving sprocket.

Wheels also are built up with stronger spokes and heavier rims, and, although our 26in. tyres are often decried in favour of the American 28in. sizes, it is a point of interest to learn that the latter country is now standardising a 27m. tyre, which diameter is actually the measurement of several of our nominal

"26in." tyres of 21/2in. section.

Speed and Ground Clearance.

IF a machine is to be used under truly adverse conditions, high speed is not conducive to extended service. It is proved that a 20 m.p.h. average can be

maintained only with difficulty once main roads are left behind, and in consequence there has been no inducement on the part of our manufacturers to design high-powered solo machines such as those which have developed in the United States as a result of the interest betrayed in the trans Continental records so popular there. Sidecars are almost universal in this country, but not quite so evident in places where road clearances are a determining factor in the use of the motor cycle. A solo machine with a five-inch clearance beneath its crank case will go almost anywhere; hitch an underslung chassis to it, and in rough country it is equipped (often literally!) with feet of clay. The narrow rutted lanes and tracks in districts served by horse transport may be quite impassable to the sidecar outfit with low underslung chassis, and yet easily negotiable by a solo machine with very little clearance in its own wheel tracks. th th th

" Overseas " Testing Ground Wanted Here.

ONLY a little time before the war it was suggested in these pages that a trials course, accurately reproducing overseas conditions, should be sought

in this country, so that manufacturers would be in a position to test their designs without journeying to obtain first-hand impressions. suggestion received the support of the trade and the A.C.U., and matters were so advanced that a small committee of overseas motor cyclists who were in the country actually commenced the search for a suitable test route amongst the moorland districts of West Yorkshire. The events of 1914 caused the project to be dropped, but it now appears that an open reliability trial organised by a motor cycle club in the same district will take the place of the abandoned one. Although no watersplashes are to be included, the general nature of the country ensures that the machines will be tested on severe gradients, roughly paved surfaces, grassy moorland tracks, and roads that wind up to the hill tops over outcrops of rock and the shingle swept down by the floods of winter. Causes of failure and the percentage of failures in such an event will throw an illuminating sidelight on the suitability of machines for any condition of service.

A Selection of Letters from Feiders scattered all over the World. Buying in India.

Witting from Benares, India, on the subject of excessive prices, "F." says:
"I should like to add my warning to those already furnished by other correspondents in India for the benefit of any of your readers who may be contemplating motor cycling in India.

"Boyley occurs, boyle little or nothing in steel, and other

"Regular agents have little or nothing in stock, and other dealers are charging prices that put home profiteers quite in the shade. As an instance, I quote from recent advertisements: B.S.A. chain-cum-belt 4½ h.p. for Bs. 1.440, and B.S.A. No. 2 sidecar, Rs. 600. The actual cost of import of a heavy sidecar outfit is about £12, including insurance, while £7 odd similarly covers the cost of landing a sidecar alone at Bombay or Calcutta. It is difficult to give the equivalent of Rs. 1,440 in English money, owing to the variation in exchange, which in six weeks has risen from 2s. 3½d. to 2s. 11½d., and fallen to 2s. 7d. But the advertisement probably relates to a machine paid for with exchange at 2s. 4d., and the outfit would be £235.

Overseas Section,-

"I left England in December, and brought with me as personal luggage a B.S.A. chain-cum-belt, bought at list price at home. All it cost me to bring it was between £4 and £5 for packing and carriage to Liverpool, and customs duty at 10% ad radorem, with about £2 5s. railway ireight up country, less than £110 in all.
"I add one warning. Packing should be carefully done in a box, not a crate; the machine should be partially discovered."

mantled, and all parts carefully secured against possibility of movement, however rough the handling, and whatever position the box may be loaded in:"

Motor Cycles in the Baltic States.

A reader who was on active service at Riga sends many interesting details of the conditions lie found there. Apparently, the motor cycle is not a vehicle best suited for pleasure riding on the type of roads common to the district around Riga. The rate of exchange is apparently very favourable to those with English money, since a machine which would bring at least £150 here was bought by our correspondent for £9! He writes:

"I was attached to a Lettish armoured train, and during the Lettish advance from Riga, and the capture of Mitau, saw much booty captured from Bermondt and his renegade Russians and Von der Goltz's Germans.

"A large number of motor bicycles were captured at Mitau. and further on the Mitau-Shavli Railway. We saw only one or two German-made machines (Benz and N.S.U.), one or two German-made machines (Benz and N.S.U.), and some few British (mostly 1915 or 1916 Royal Enfield Combinations, and one James). All the remainder were the ubiquitous Harley-Davidsons—fairly recent models. It would be interesting to know where the Hun got these, and whether the American trade "pnsh" in Germany is not helping to "do in" the Baltic States somewhat. I might add that in Mitau one of my gun's crew was offered a Harley for £9 in English money! Too late, he told me

a marrey for 20 m of it!

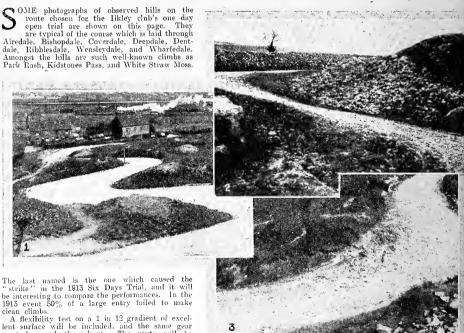

"Roads in Lettland are either mountainous cobbles or mere farm roads. I saw the James (attached to armouved trains headquarters), two np, bouncing over cobbles, and through 6in. of snow, doing a very good speed, and standing the complement of the prough page it got.

through bin. or snow, doing a very good speed, and standing app wonderfully to the rough usage it got.

"I had The Motor Cycle sent me every week, and passed it on to the Train Commander, who was very interested. Prices gave him rather a shock, as Lettish roubles are between 65-120 to the £. Petrol there is here in plenty, but lubricating oils are scarce."

Overseas Conditions in an Open Trial,

The likley L.C. and M C.C. One Day Trial to be held on June 5th. Mileage: 157%. Course: Mountain and Moorland Roads through Wild Scenery. Observed Hills: Six.

POLICE TRAPS.

Sir,-The method adopted in a police trap between Sideup and Swanley recently may interest your readers.

An Army lorry was stationary at the side of a straight

stretch of road, and a cushion was dropped from the rear as any suspect passed, the cushion being easily visible from a point a quarter of a mile further on.

Incidentally, a speed of 45 m.p.h. would have been perfectly safe on this particular stretch of road, and it seems to me that it would be better if the authorities would differentiate between "dangerous" driving and "illegal" driving. Blackheath, PINCHED.

IT'S AN ILL WIND.

Sir,-I noticed the other day what I think is the cleverest dodge of the season. In this town (Leeds) there are many tramilines which do not under any circumstances remain at the same level as the roadway, and at one place here have sunk considerably. Recently at this spot there was a strong side wind blowing, and I noticed the rider of a very baby two-stroke riding in the tramlines, where he was quite protected from it, only his hat protruding.

In case no one has thought of the undoubted advantage of

In case no one has thought of the amount of this tip for sunken tramlines in a side wind, I am sending this tip for taking advantage of them in the hope of causing motor cyclists taking advantage of them in the hope of causing motor cyclists. to take a more lenient view of what up to the present has, I believe, been considered the cause of many broken rests and bent hars, torn overalls, and unparliamentary language.

I append the usual disclaimer to any interest in any tramway company, except as a satisfied user in future of the protection from the winds of the earth they have so thoughtfully provided for motor cyclists.

U 4830.

THE MOTORISED BICYCLE.

Sir,-It occurs to me that some of your readers might be interested in my experience with an auxiliary engine, as I have had the engine long enough to test its general efficiency. There are, I believe, several makes on the market, but I can only speak of the Simplex motor unit, made by the Patrick Engineering Co., of Birmingham, and sold by Messrs. Henry

Garner of the same city.

I may say that I am a middle-aged professional man, and my bicycle is a ten-year-old Centaur roadster, with a threespeed gear, and in excellent condition. The district is Nottingham—a place of appalling hills—and my motor cycling inends were scoffingly pessimistic as to the investment. They said it would not help me up hills and that the bicycle

and engine would shake to pieces.

After the usual difficulties due to inexperience, I find that it carries me along at a steady pace of 10-12 m.p.h., or faster if carries me along at a steady pace of 10-12 m.p.t., or laster if I want it, will go up ordinary hills at a good pace, and will climb practically anything with additional pedalling, so easy as to be a pleasant change. The engine is compact, vary accessible, and beautifully made. Bicycling is now a pleasure, while before, in this district, it was either impossible or a toil. None of my friend's predictions have come true, and I see no reason why they should if it is remembered that the combination is not a motor cycle, and must be used with

regard to its limitations. I have no interest in the firms that make and supply the engine other than the fact that I bought the engine from them. Other attachments may be as good, but I have no

them. Uther accounts the working.

A MIDDLE-AGED CYCLIST.

HILL-CLIMBING ON FORMULA.

Sir,—As an old reader of your paper, and part organiser of several hill-climbs, I should like to protest against the grow-

ing practice of obtaining results on formula in these events. Let me say at once that I have no objection to the proper use of formulae for finding results, but competitors should be confined to their own classes. In the recent hill-climbs on Kop it was noticeable that lightweight machines were the winners in every class.

It seems very unfair that the larger machines should not have even a slight chance of winning, since in cases where lightweights may enter for all classes a large machine must be about 50 m.p.h. faster up the hill to equalise the chances. J. E. G. HARWOOD,

Hon. Sec. Oxford University M.C.C.

PLUG EFFICIENCY.

Sir,-I am the rider of a 5 h.p. J.A.P. combination, in which I have tried almost every known make of English plug, having tried as many as twenty different models in

English plug makers advertise their plugs in your columns as being able to withstand almost anything, yet I have not found a single English plug that will stand up to my engine for ten miles. Some will run two miles, others four, and so on. I am using two old Bosch plugs, about ten years old, and they will stand any test I may put them to. I have exchanged about eight new well-known English plugs for a similar number of old Bosches, all of which I find stand up to the most severe test. Can anyone tell me the cause of this or the secret of it?

If any English manufacturer cares to have a plug tested to prove its efficiency, he can have it tried in my engine AN OLD HAND. gratis.

Ashington.

EXTRACTING MUDDY SHOES FROM OVERALLS.

Sir,—Anent "Ixion's" remarks in *The Motor Cycle* for May 6th re muddy shoes soiling the inside of motoring overalls or leggings after a journey during wet weather, I used to experience the same trouble.

To avoid damage to nether garments, I used to resort to the somewhat irksome method of removing my shoes—not a proceeding one relishes, away from home, when merely dis-carding overalls, but still better than damaging nether garments got up (in "Ixion's" words) to appear at a swagger function.

I hit upon a very simple expedient, which entirely obviates

this and works wholly satisfactorily.

Take an old stocking, the foot of which is worn out and of no further use, and cut the foot off (merely to reduce the or no further use, and cut the foot on imercy to reduce the bulk), and throw aside. The stocking leg can then be taken about in a very small compass. At the journey's end, after undoing catches and freeing the overall straps' from the shoes, draw the stocking leg over each shoe in turn, and withdraw the foot through the overall. Covered in this manner, the operation is perfectly clean, and any soil adhering to the stocking is inside, and when dry is easily burehold awar. brushed away.

Since hitting upon this idea, I have always stripped off my overalls with perfect cleanliness, and would commend it to "Ixion" and motor cyclists in general.

An article made of cloth or even waterproof material, made so as similarly to enclose the shoe, would, if preferred. serve J. GRAHAM. the same purpose.

WITH THE CLUBS.

(Left) A Leicester and District M.C. club member created interest by "stuntinterest by "stunt-ing" in a watersplash at a recent club meet.

(Right) A scene at British Camp, Malvern, on the occasion of a Worcester M.C.C. run.

REUNION OF EX-D.R.'S.

Sir,-One of your correspondents wonders why the ex-R.E.D.R.'s cannot have a reunion, while other units can. The units that do have these reunions are those representing part of the country and recruited for the most part from that district. The D.R.'s are now scattered to all parts, and there is not one in a hundred who could spare the time—or money—to make a long journey.

SIDNEY DU ROSE.

Sir,—In reply to Cpl. Cutwell's letter in a recent issue, I would like to state that already I have been in touch with Capt. How (late O.C. D.R.'s, R.E.) on the subject of a D.R.'s reunion and dinner.

would suggest that an Old D.R.'s Association be formed of those who joined as D.R.'s prior to Lord Derby's scheme. The reunion could be held in London and the provinces. All those in the provinces could not come to London, and vice versa.

As one of the original 1914 D.R.'s, I can say with a good deal of certainty that the idea is not only welcomed, but needed. We were all the very best of pals in the early war days, and we all feel, I am sure, anxious to meet again, and to do so would be delightful.

F. C. SCHOFIELD, Late Sgt. D.R., Capt. R.E.

FINISH OF NEW MACHINES.

Sir,-I notice from time to time letters from readers complaining about the condition of new machines.

Three mouths ago I received direct from the makers an Ivy i.o.m. model. Its condition was all to be desired and absolutely ready for the road Its finish, too, in my opinion, could not be better. I have run it every day since delivery, wet or fine, and I have had no trouble whatever.

I have no interest in the firm, but just a very satisfied B. W. owner. York.

Liverpool.

Sir,—With regard to your query on page 505, in your issue of May 6th, "Are new machines well finished?" I can safely say "Not all," for whilst looking over a brand new two-speed two-stroke, costing over £70, last week, for a friend—an absolute novice—the following required attention: Carburetter (badly flooding, and sides so roughly finished that the throttle pulled the extra air open and both stuck open). Drain tap to crank case (just hanging on by one thread). Added to these was the fact that sundry nuts were by no means "hand tight." My friend's fate can be imagined, if these items had not been attended to before he took to EX-CPL., R.E. the road. Tavistock

CONSIDERATION TO FARMERS.

Sir,-The time of year has come when fields are shut up for Sir,—the time of year has come when heids are shut up tor hay, and with it the advent of the flower gatherer. I would ask metorists not to go into fields to pick flowers when it is obvious that the grass is intended for mowing. There is nothing much more annoying than to see motor cycles constantly stopping at such fields and the passengers, strolling about in the long grass treading it down. There are plenty of flowers to be found in meadows where stock are grazing, and materials are with a real latitude to confirm their territory. and motorists would be well advised to confine their attentions to such ground. FARMER. Hailsham.

LIVERPOOL M.C. SPEED TRIALS

Sir,-I should just like to make a word of comment upon In every way admirably organised, yet great the above. anxiety must have been caused to those in charge by the gross thoughtlessness of the spectators.

Despite all that was done by the marshals and police by

way of warning and protests, yet the public would insist on encroaching upon the track. At times the track close to the finish appeared no more than 2ft. or 5ft. wide on account of the number of people who had stepped forward from the side and were not willing to step back again until the competitor was almost upon them. One rather dreads to think of the result that would have followed a tyre burst or any similar mishap.

Women were notable offenders in this respect, and one girl who, to my knowledge, had spent most of the afternoon in the centre of the track, was heard to remark on leaving that "the organisation was splendid, but that it would have improved matters if some sort of boarding or barrier had been

erected to prevent spectators getting too close"!

A little more thought on the part of the public or even compliance with the loudly uttered warnings of the marshals would have helped competitors and officials considerably, and also afforded a better view of the race to those people who were sufficiently sensible and sportsmanlike to "keep off the track."

AN INTERESTED SPECTATOR. track."

ERMAN GOODS.

Sir,-1 am delighted to read your notice, on page 513 in our issue of May 6th, re advertising German goods, and eartily congratulate you on your decision.

We English are too easy going in all such matters, and orget far too quickly that, although we are at peace with

ermany now, two years ago?
Unluckily, the public do not realise that even now the lermans are endeavouring to revert to their old game of ooding the British markets with inferior merchandise (withut the familiar words "Made in Germany.") to the disdvantage of British manufacturers; the rate of exchange iaking this particularly easy now.

The German theory is-"If it costs £10,000 to turn out 0.000 articles for home use, an additional 10,000 for export rill not necessarily cost a further £10,000, since so much of he production expenses will not necessarily be duplicated.

The Britisher does not yet seem to have learned to look t things in this (the correct) light.

Unless we support home industries we shall shortly have he 1914 position of affairs again, i.e., overrun with German goods (?)." EDGAR COHEN:

REMIUM HUNTING.

Sir,-I notice in your issue of the 13th inst. a letter from he President of the British Cycle and Motor Cycle Manuacturers' and Traders' Union, Ltd., with reference to the dvertiser who requires a premium on his motor cycle. I m of the same opinion as Mr. Hill, in the case of certain eople who had the foresight to order two or three machines a advance, with the intention, when ordering, of sclling at profit; but there are probably others besides myself who re now not able, financially, to take over the machine they ave ordered, and who therefore feel they have a right to lemand a premium in order to get a little return on their leposit, which has been locked up so long. I ordered a nachine, a Norton, in February of last year, paid my leposit, and have been waiting ever since. I now find I m not in a position to take over the machine, and feel I m quite justified in trying to obtain a premium. I wonder what your other readers have to say regarding it. E. A. BEANES,

ARBURETTER DESIGN.

Sir,-The reply of Mr. Binks to my letter only serves

emphasise my point. The Scott rider who uses his carburetter is advised to btain a hot air pipe with an elbow, flexible pipe, a muff, nd, of course, the necessary nuts and bolts, unions, etc., a order to induce warm air necessary for economy on a two-

troke engine.

Many of us are aware what a splendid instrument the sinks carburetter—is, but on the Scott machine it is; to ty mind, an attachment not specially designed for a

nique engine.

The Scott engine suggests for itself that the carburetter hould form part of the top of the crank case. The inventor aw this, and acted accordingly. But petrol was cheap in hose days, and people were much less keen about the erfecting of carburation than they are now.

The Scott engine is not inherently a petrol drunkard.

There is no reason why it should not give 100 m.p.g.,

vithout such gadgets as elbows, muffs, clamps, and screws; nd to obtain this improvement it requires a carburetter

pecially designed for it.

I contend that the original Scott carburetter, re-designed, o as to put under better control by the rider both the etrol and warm air supply, would considerably enhance he esteem in which this motor cycle is now held by present and potential riders.

CLERICUS.

Paisley.

TARTING TIPS.

Sir,-In reply to "J.M.M.'s" queries re starting a B.S.A., he following ought to be observed:

1. Prime the engine, and kick round gently two or three imes to free the engine and the clutch.

The jet should be open threequarters to half a turn, nd the throttle and air levers open about 1in. (i.e., 1in. at he black handles).

The engine should now start easily. If the engine is ranked round until the exhaust valve is just opening the ngine can be started without touching the exhaust lever at

the first kick after paragraphs (1) and (2) have been observed. "C.B.M.-B." advises scrapping the B.S.A. carburetter. Personally, I think this unnecessary, as I can start my own 1919 B.S.A. at the first kick five times out of six, and the adjustable jet never causes me any anxiety or trouble, and the consumption is just over 100 m.p.g.

Incidentally, I fitted a Bowden-controlled handle clutch, as I ride the machine solo. This is a great improvement, and if any of your readers would care for details I shall be

pleased to supply them.

I forgot to state earlier that the engine can also be started easily on second gear without the use of the exhaust lever; but in this case the exhaust valve must be fully open. As before the valve lifter need not be touched. Less effort is required, but this method is not quite so certain.

11. WILLOUGHBY.

DELIVERIES IN SCOTLAND.

Sir,-A few weeks ago I read in a motor cycle journal that one could almost say what district one was in by the most prevalent make of motor cycle to be seen. In Bristol it was Douglases; Coventry, Triumphs, etc.; but I must say in Scotland it would need some imagination to know where one was, unless, of course, "Yankeeland."

The deliveries of certain makes of English machines to Scotland has been simply scandalous. I ordered a certain wall known two them

well-known two-stroke about six months ago, and, so far, have no idea when I may get delivery. During March this firm did not deliver one single machine to its West of Scotland

There are thousands of buyers waiting for heavy machines here at present; and I only hope that, in the future, when buyers are not so plentiful, that those concerns who have not forgotten Scotland will get their due reward.
Coatbridge. ONE OF MANY SCOTS.

SUMMARY OF CORRESPONDENCE.

LENSES IN GOGGLES .- Since the publication of Mr. E. R. Toyster's letter in our issue of the 13th, regarding suitable lenses for motor goggles, we have received a number of letters mentioning opticians who undertake this class of letters mentioning opticians who undertake this class of work; the 'names of which are given below. Charles Ledsham, 455, High Road, Tottenham, N.17; T. H. Robbins, 14, Bull Ring, Kidderminster; Clement Clark, 16, Wigmore Street, London, W.1; Messrs. Welson, 28, Church Road, Upper Norwood, S.E.; Paxman and Sons, 641, Rochdale Foad, Manchester; Melson Wingate, Ltd., 30, Wigmore Street, London, W.; W. Jones, 21, School Lane, Wallasey, Cheshire; Aitchison and Co., Ltd., 6, Poultry, London, E.C.2; Marratt and Ellis, Great Tower Street, E.C.; C. E.C.2; Marratt and Ellis, Great Tower Street, E.C.; C. Ledsham and Co., 50, Stonegate, York: The Triplex Goggle and Lens Co., Ltd., Triplex House, 15-17, Middle Street, E.C.1; E. R. Brydges, 33, New Road, Gravesend; Negretti and Zambra, Regent Street, London; M. N. Dunscombe, Ltd., St. Augustine's Parade, Bristol; J. B. Jacquemin Bros., Ltd., 65, Hatton Garden, E.C.; and Blooms, Ltd., 265, Tottenham Court Road, W.1.

The Vogue of the Outside Flywheel.

There are several new $3\frac{1}{2}$ h.p. engines with outside flywheels at present undergoing test.

The Modern Post-chaise.

A few days ago a young couple attempted to elope to Scotland on a sidecar.

Air-cooled Engines.

Designers of air-cooled engines may be divided into two distinct schools, those who favour very thin fins and those who believe in thick ones. After all, it is largely a matter of calculation.

Petrol Supplies.

A roadside supply pump has been erected in Kenilworth on the main Kenilworth-Warwick road. This installation will bear an illuminated sign at night, and will undoubtedly prove a great convenience to Midlaud motorists.

Imperial Motor Transport Council.

Committees have recently been appointed by the Imperial Motor Transport Council to take steps to encourage and develop additional motor fuel supplies in all parts of the Empire and to encourage the extended use of motor transport respectively.

Heavy Fine.

We have received information that a youngster of only seventeen years of age, riding a 3 h.p. Enfield, was recently fined £5 and 5s. costs for exceeding 10 m.p.h. m the ten-mile limit at Preston Park, Brighton. It was his first offence, and he had a clean licence. Comment is needless!

International Touring Alliance.

A conference of touring organisations was recently held in Paris, and an international alliance has been founded which will facilitate the way of motor cyclists touring in foreign countries. The head-quarters will be at Brussels, the secretary being M. Seavt, president of the Touring Club of Belgium. The organisations associated with the movement include:

Automobile Association and Motor Union.
American Automobile Association.
Touring Club of France.
Touring Club of Belgium.
L'Union Vélocipédique de France.
Cyclists Touring Club.
Touring Club *. Italy.

In South Africa.

There are over 4,000 motor, cycles registered in the Cape Province, over 6,000 in the Transvaal, nearly 2,000 in Natal, and less than 300 in the Free State.

A. G. Cocks Bereaved.

A. G. Cocks, who entered for the London-Edinburgh, on a 23 h.p. Black Prince Runabout, did not start on account of the sudden death of his father.

Helmets Wanted for T.T. Riders,

A great difficulty has been experienced in obtaining regulation helmets for T.T. entrants. The A.C.U. will be glad if competitors in past Tourist Trophy races, who have approved helmets for disposal, will immediately communicate with the secretary of the Auto Cycle Union, 83, Pall Mall, London.

Any information which the secretary can receive which will enable him to obtain helmets for this year's T.T. will be most welcome.

The Foundation of a Rumour.

Because the winner of the Victory Cup lent-his 2½ h.p. machine to a fellow competitor as he was competing or a 2½ h.p. model of the same make, and because the latter retired and left the machine at a garage in its owner's name, all sorts of mischievous rumours were current last

week. In justice to the competitor concerned, and to the club, the organisers of the trial thoroughly investigated the rumours, and so discovered their source.

To Assist the Maimed.

In order to demonstrate the utility of hand - propelled and motor-assisted cycles for those who have lost limbs, our contemporary, The Motor Cycle and Cycle Trader, is organising a rally and demonstration for war-maimed men. The venue will be the Inner Circle, Regent's Park, N.W., and the rally will be held on Saturday, June 12th. Fifty machines of various types have already been promised, and an open invitation is extended to all actual users of such machines.

Special Features.

THE LONDON-EDINBURGH.

NOTES ON THE FRENCH SIX DAYS.

T.T. ENTRIES.

Alcohol from the Sea.

It is said that there is practically an unlimited supply of power alcohol in seaweed.

The Latest in Mascots.

A mechanical mascot in the form of a figure which bows and raises its hat is the latest thing in ornaments for the radiators of cars.

Renovations.

A correspondent asks whether it is possible to have a worn belt re-rubbered —and very wisely omits to enclose his name and address.

Wired-on Tyres.

Those who are interested in the car world will be familiar with the term "straight-sided tyres." The latter are merely the application of our old familiar friends of pedal cycle days.

A modification of the system might easily be applied to motor cycle wheels,

easily be applied to motor cycle wheels, and a change of tyres could be effected with the minimum of trouble, and without danger of "trapping" the tube.

A lamp—and windscreen. Years ago competitors in the London-Edinburgh sought; for the biggest lamps possible; fighting shy of nothing in the way of bulk, so long as the light was effective. In these days o. efficient electric lighting dynamos and mag-dynamos the greatest worry of night riding is to a Ligextent climinated.

pring Frames.

The number of spring frame designs abmitted to us every week is proof of the condition of present-day roads.

Benzole Goes Up.

We are informed by the National Benzole Co. that the price of National benzole has been increased by 3d, per gallon, dating from May 20th.

Gas v. Electricity.

Despite the great advance made in electric lighting, there was a prevalence of acetylene lamps among the London-Edinburgh competitors.

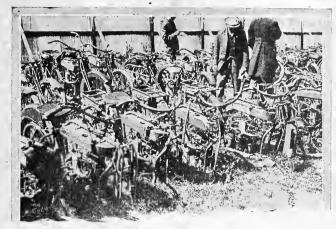

Confidence.

The 23 h.p. de Dion ridden by B. Fellowes in the Loudon-Edinburgh run bore the date 1899, and is some years older than the rider, Incidentally, if had on the tank a Latin inscription to the effect that it is unwise to trust in appearances.

Second-hand Prices.

The following general summary of current second-hand prices enables readers to follow the trend of the second-hand market. The figures given show the highest and lowest prices.

A.J.S., 6 h.p., sidecar, 1910-18	£130-£105
6 h p sidecar, 1010-20,	1205-1205

Triumph, 4 h.p., 3-speed, sidecar, 1919	£125-£155
-	<

THE JUNK SHOP.

A group of unfit ex-army motor cycles which are being sold by auction at Slough. Many of these decrepit machines are being reassembled and overhauled and then offered to the public.

Lighting Regulations.

Motor cyclists must insist upon being allowed the same powered lamps as cars.

Found

Mr. A. C. Selby, Hazelmere, South Hill, Bromley, recently found an exhaust valve for a 3½ or 8 h.p. machine on the Hastings Road, near Bromley Common.

Motor Cycle: Thief's Novel Ruse.

A Bromley (Kent) motor cyclist's Douglas was stolen by a novel ruse. A stranger offered him £1 if he would examine a second-hand Douglas for sale at a local botel, saying he had an appointment with the owner. Whilst the Bromley motor cyclist was trying the second-hand on the road, the stranger said he would try his friend's new machine. He rode off and has not been seen since.

The Open Market.

An advertiser recently asked for a powerful solo mount in exchange for an ermine fur.

Tax Free.

Motor cycles used by "The Crown" are not mentioned in the Statute, and are therefore not subject to taxation.

The Motor Cyclists' Lighthouse

When is the lighthouse at Roxley Corner, Foots Cray, on the Sevenoaks Road, to be put into commission again? It came under Dora, of course. An A.A. patrol is now on duty at the spot.

A £150 Co.

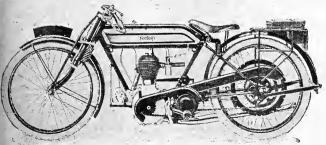

The American Spacke car, which has shaft drive, an air-cooled V twin engine, and epicyclic two-speed gear, sells in Africa for £150, complete with electric lighting. In U.S.A. its price is about £65.

Worst Road under Repair.

Said to be "the worst section of road near London," the Sevenoaks Road at Bromley Common is under repair. Recently a coroner's jury held the defective state of this road responsible for a cyclist's death. The direct Westerham Road is still in a bad state. The largest holes are known by name.

Legal Limit.

Will the existing speed limit of 20 m.p.h. be increased? This question is to be considered by the Departmental Committee on the Taxation and Regulation of Road Vehicles. If the report of the Special Committee on Lighting is any criterion, we may see something as absurd as a different speed for cars and motor cycles.

The T.T. Norton is practically the standard sporting mount, the only changes are a gear box without kick-stater giving ratios of 4-5 and $7\frac{1}{2}$ to 1, the substitution of footrests for footboards, a new tool box and an extra brake.

T eight o'clock last Friday evening A leight of the 316 starters was despatched on his 400 mile journey by Mr. A. V. Ebblewhite, amidst an enthusiasm possibly unsurpassed in any London-Edipburgh run. Fine weather prevailed for the opening of the trial, which proved, as was anticipated, the best supported and certainly the most interest-ing ever held. The climbing of Kirk-stone added incident to a run which had of late years, with the reliable machines obtainable to-day, developed in-

to a featureless twenty-four hour ride.

The following is a list of starters tabulated according to the make of machine: A.B.C.

A scene at the start. Competitors' motor cycles were hidden by the crowd.

Record Number of Starters. Observations on Two Non-stop Sections of the New Route.

I T is becoming quite enstomary to begin a report of this popular event of the Motor Cycling Club by stating that the entry was a record one. When the list of those competing first totalled over 200 it was thought that the trial was unwieldy, and this year when the entries amounted actually to 381 there were misgivings as to whether so large a number could be conveniently handled on the road. In practice, however, the run went off extremely well, and was even a greater success than its dozen predecessors.

Lighting Arrangements.

The start took place on Friday evening in glorious weather, a.d. there seemed every prospect of a fine run. The Metropolitan police were splendid as usual, and the huge number of riders was despatched without a hitch. A rapid glance round the competing machines revealed a good deal that was interesting. A multiplicity of lamps and generators shows signs of dying out, and it is more common to see one good lamp and a dissolved acetylene cylinder. Electric lighting for solo mounts does not seem to have made any real progress, but on sidecar outlits there were numerous instances of the Lucas installation being used, while C. S. Lake had fitted a full size C.A.V. dynamo lighting outfit to his Zenith and sidecar.

Arthur Candler, one of the early hon. secretaries of the M.C.C. and founder of the Edinburgh run, rode a 3½ h.p. Rover. Another old competitor was Mr. Johnson,

the London manager of Humbers, who took part in the event in 1904. On Friday last he was represented by his son, who rode one of the 4½ h.p. flat twins of this make.

Quite the most interesting (from an historical point of view) of all the machines present was B. C. F. Fellowes's 2\frac{3}{2} h.p. De Dion, the engine of which was twenty-one years old, being dated 1899. On the tank was the Latin motto ne fronti crede, and a three-speed Armstrong gear was fitted. This wonderful engine pulled its rider right through to the finish. May our readeus take note of this fact when they write and ask us to state what is the life of a motor cycle engine.

The organisation at the start was good, but the task of the officials would have been easier had non-competitors refrained from attempting to drive about in the crowd while the start was proceeding. Each man was timed out by Mr. A. V. Ebblewhite, while the official cars were driven by two old-time competitors, Messrs. J. van Hooydonk and W. H. Wells, the latter carrying Mr. F. T. Bidlake, the timekeeper at the finish,

Road Conditions and Catering.

From the start to Digswell the roads were in good order, but a very bad stretch of tar was encountered about two miles short of this village. Broad daylight lasted us till Baldock, and even then we only lit our lamps to comply with the law, and it was light enough to see almost as far as Biggleswade, the first

check, forty miles from the start. Here, as before, the genial host and hostess of the Swan Hotel made us all really welcome, and supplied the most appetising refreshments. All that was required for man and machine was to be had in abundance, and the riders left amply fortified for the long drive to Grantham through the dark.

Through the Night.

To an old participant in this event, two stretches of the run seem longer than the others—the night drive to Grantham and the last stage of all. To average twenty miles an hour in the daylight is easy, but to maintain this average in the dark, even over an excellent and easy road, is somewhat of an effort. In the pre-war runs, many a yarn was told even as early as Biggleswade, and many more at Grantham, of dire lamp troubles, breakdowns, and other terrors of the night, but now incidents are all too few from the journalist's point of view. We set out from the first check in the

We set out from the first check in the glorions starlight night with a batch of half a dozen machines just ahead, including the three new Metro-Tylers ridden by J. Stuart-Bennett, G. F. Ammon, and O. C. Roberts. They are very neatlooking mounts, which ran most consistently.

Our immediate companious were a group of members of the Public Schools M.C.C., who all rode together, and of these J. D. N. Dickson Hill (5 Zenith) was found in trouble near Grantham.

The first sign of this was a stationary light in the centre of the road, which caused some bewilderment. On approaching it was found to be an abandoned torch, dropped while its owner was endeavouring to start. We restored to him this needful accessory, as his head light had failed, gave him the push-off he required, and rode with him to Grantham, where the first breakfast was served. Here all the competitors we questioned reported an excellent run. Even head light troubles were practically non-existent, but tail lamps were proving to be as unsatisfactory as ever. The faintest glimmer of dawn was visible in the east as Grantham was entered with the vanguard, but lamps were not to be extinguished for many a mile further north, owing to the fact that the start was an hour earlier than in previous years.

Tail Light Trouble.

Poor Dickson-Hill's troubles ended in a climax at Gouerby, just after the breakfast stop, as he took a corner too fast, colliding with a heap of stones. All along the road and right through the night the police were of great assistance, but for the first time on a London-Edinburgh run the Newark constables exercised their authority. Just beyond the town one conscientious policeman evinced a marked interest in tail lamps, and enjoyed (from his point of view) excellent sport, and this, if you please, only shortly before lamps could be extinguished. One of the travelling marshals fell a victim, but fortunately many others, owing to the fact that they rode in groups, escaped. By next year there must be some improvement in rear lighting arrangements.

The next check was at Doncaster, and outside the garage there was mounted an ancient high bicycle, and under it the words "disqualified, arrived too early." For the early comers the sun rose before reaching Retford, but the clouds soon hid it and the run was continued in cold dull weather with a rising south-westerly wind. H. B. Bröwning [33 Scott), who burst a cover outside Doncaster, found a friend in need in the shape of a fireman. This

excellent sportsman ran to the fige station, cut off a piece of hose, slit it down the centre, and thus improvised an excellent gaiter, and when offered payment refused it, saying he was a fellow motorist and drove a 60 h.p. fire engine. Robertson-Browne (8 Henderson) picked up a nail between Newark and Grantham.

Rough Roads.

There was some very rough road north of Doncaster, quite the worst hitherto encountered, and this continued along the old route frequently followed in previous runs to the cross-roads, where the men were directed by one of the many useful A.A. scouts from the main road to Hare-Here the course is set in a westerly direction, and the wind, which had hitherto been only tiresome, became really trying. Parts of the road were very rough, and the dust was so appalling that we almost prayed for a shower of rain, and wished that the excess of tar encountered in Hertfordshire had been directed to this part of the world. There was excellent organisation at the second breakfast at the Middleton Hotel, Ilkley, and numerous well-known northern riders were present to help at the check. Among these we may mention Norman Longfield and H. W. Fortune. At this point more than half of the total journey had been covered, but the next section held the crux of the trial.

The Climb up Kirkstone.

The Scott on which one member of our staff was travelling acquitted itself well, but Kirkstone proved its reāl worth. To say that the famous climb was dreaded by most of the competitors is no exaggeration. It was made out to be worse than it was, and chiefly, we believe, because those who had ascended it in the 1913 Six Days Trials and before had forgotten it. However, it is quite a fair hill, and every motor bicycle made should climb it. Its approach is narrow, and right in the village of Ambleside, and we had to take it with a non-competing car drawing a trailer full of petrol cans, partly blocking the fair way. The low gear was engaged at once,

rne sc.) near the summit

ng-Standard) leading

Humber)

and kept in as the engine roared its way up the numerous steep pitches and round the easy bends. Once we changed to top, then up and up the Scott soared. Then came a fast stretch over a falling grade, and afterwards the final "struggle" round a sharp bend and the worst was over.

Observations on Kirkstone Pass.

Kirkstone Pass proved an attractive vantage point for hundreds of motor cyclists and car owners, who nearly all congregated at the "Struggle," the culminating stretch, which is as steep as 1 in 4½ at one point.

The competitors were ahead of time. W. H. Wells, the M.C.C. club captain, led the way on a Chandler car, followed by J. Van Hooydonk (Phenix car), Stuart Clark (7, F.N.) leading the competitors and incidentally making a good climb. It is, of course, impossible to individualise with such a big crowd of riders, but our three outstanding impressions after observing the riders ascend the Pass in more methods than one were:

(I.) The motor cyclists were none too successful, the lighter types of mounts providing an unusually high percentage of failures.

centage of failures.

(2.) The single-cylinder sidecar outfits were the surprise of the day, for, in the majority of cases, they made meritorious ascents.

(3.) The high-powered twin-cylinder

(3.) The high-powered twin-cylinder sidecar outfits were disappointing, frequent cases of overheating occurring and failure from other causes.

Just how many failed on the foothills of Kirkstone it would be difficult to say, but a number were seen at the roadside on the lower steep stretches of the three miles almost continuous ascent of Kirkstone. Among those we noted for clean and excellent climbs were Hugh Gibson (2½ Clyno), H. G. Bell (7 F. N.), Gayford (5 Zenith), Sharratt (Indian Scout), Jones (3½ Ariel), Kaye Don (6 Zenith), Lucas (Zenith), Edwards, Spikins, and

McLellan (Harley-Davidsons), Salter (flat twin Zenith), Body (Sunbeam), Clark (Coulson B), Redvers-Johnson (Humber), Barclay (Reading Standard), and McRitchie (Triumph). During this succession of clean climbs there were, of course, a number of failures, and a certain amount of eigine knocking by some who just got up this gruelling climb. Triumph and Sunbeam stood out among the best performances in the solo section, and Blackburne riders, too, though not fast, toured up with apparent ease and comfort. The Scott riders did well almost to a man, but their radiators were observed to be steaming in several instances. Boult on a Norton with Fhilipson pulley made a most meritorious ascent, passing three-speed mounts whose riders were footing or running alongside. Fleetwood we singled out as the best A.E.C. rider, though all did well.

The Passenger Machines.

When the sidecars arrived in bulk, rain was falling thickly, and the surface was getting hadly cut up. Bridgman (Indian sc.) was sandwiched among the solo mounts, and it is doubtful if any competitor made a better climb up the steepest stretch at the top. Wright thenderson) was good, also Nott (Matchless), whilst Temple (Harley-Davidson) was so fast that in the thick mist he was obliged to keep his electric horn going to clear the way. Newnham (4 going to clear the way. Newnham (4 Sunbeam) was one of the successful single-cylinder sidecarists, hut Crost-waite (5 James sc.) made quite one of the best ascents of the day, his success being emphasised by the fact that he followed a number of disappointing riders on big twin outfits, who either failed or just scraped up. Longman (Harley) roared past a stranded sidecar, Biggs (A.J.S.) repeating the perform-ance. Tippett (Acme) was good—in ance. Tippett (Acme) was good—in fact, the Acmes and their stable companions the Rex machines but one got up comfortably. Congratulations to Jefferys, the one-legged rider of a Norton, who got up very confortably. Several Matchless riders did well. but others stopped

The first sign of this was a stationary light in the centre of the road, which caused some bewilderment. On approaching it was found to be an abandoned torch, dropped while its owner was endeavouring to start. We restored to him this needful accessory, as his head light had failed, gave him the push-off he required, and rode with him to Grantham, where the first breakfast was served. Here all the competitors we questioned reported an excellent run. Even head light troubles were practically non-existent, but tail lamps were proving, to be as unsatisfactory as ever. The faintest glimmer of dawn was visible in the east as Grantham was entered with the vanguard, but lamps were not to be extinguished for many a mile further north, owing to the fact that the start was an hour earlier than in previous years.

- Tail Light Trouble.
